

EECS 4422/5323: Computer Vision Camera Processing Pipeline

Hakki Can Karaimer

Lab session #1: September 2017

**DEPARTMENT OF
ELECTRICAL ENGINEERING &
COMPUTER SCIENCE**

Camera = light measuring device

Simple models assume an image is a “quantitative measurement” of scene radiance.

Camera = light measuring device

Light-measuring device?

Samsung S6

HTC One M9

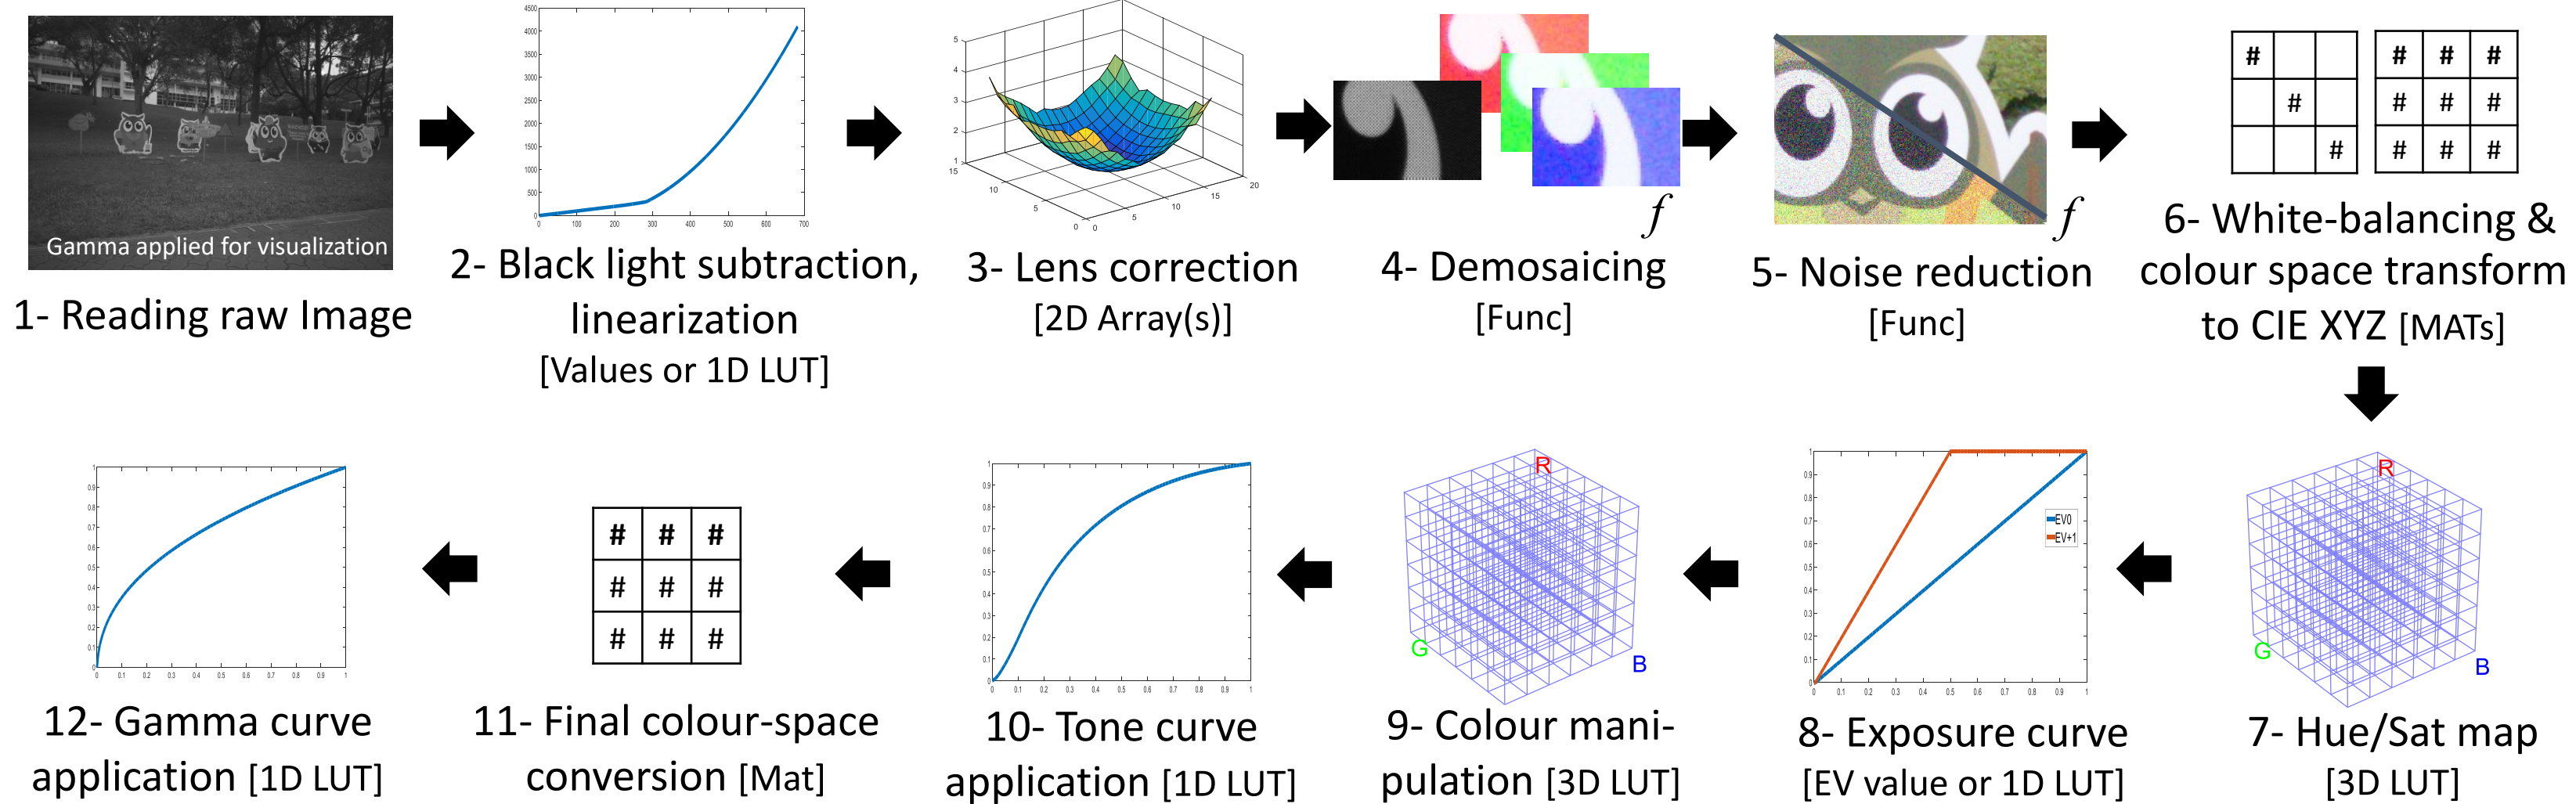

LG G4

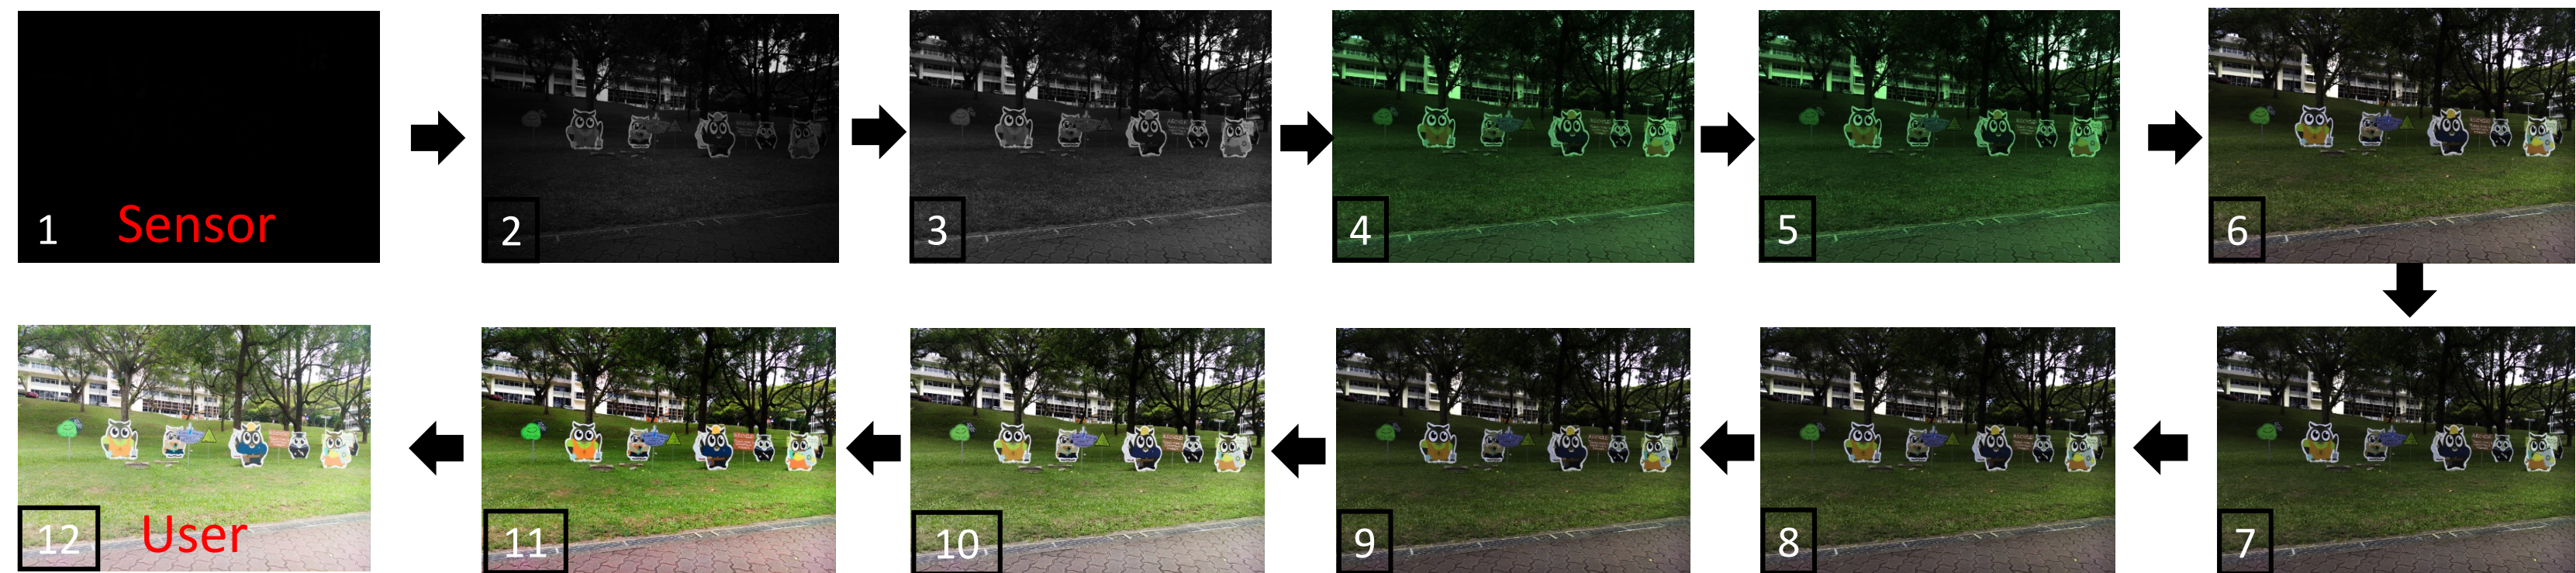

Google Camera App
All settings are the same

Stages of the camera imaging pipeline and associated parameters

Intermediate images for each stage

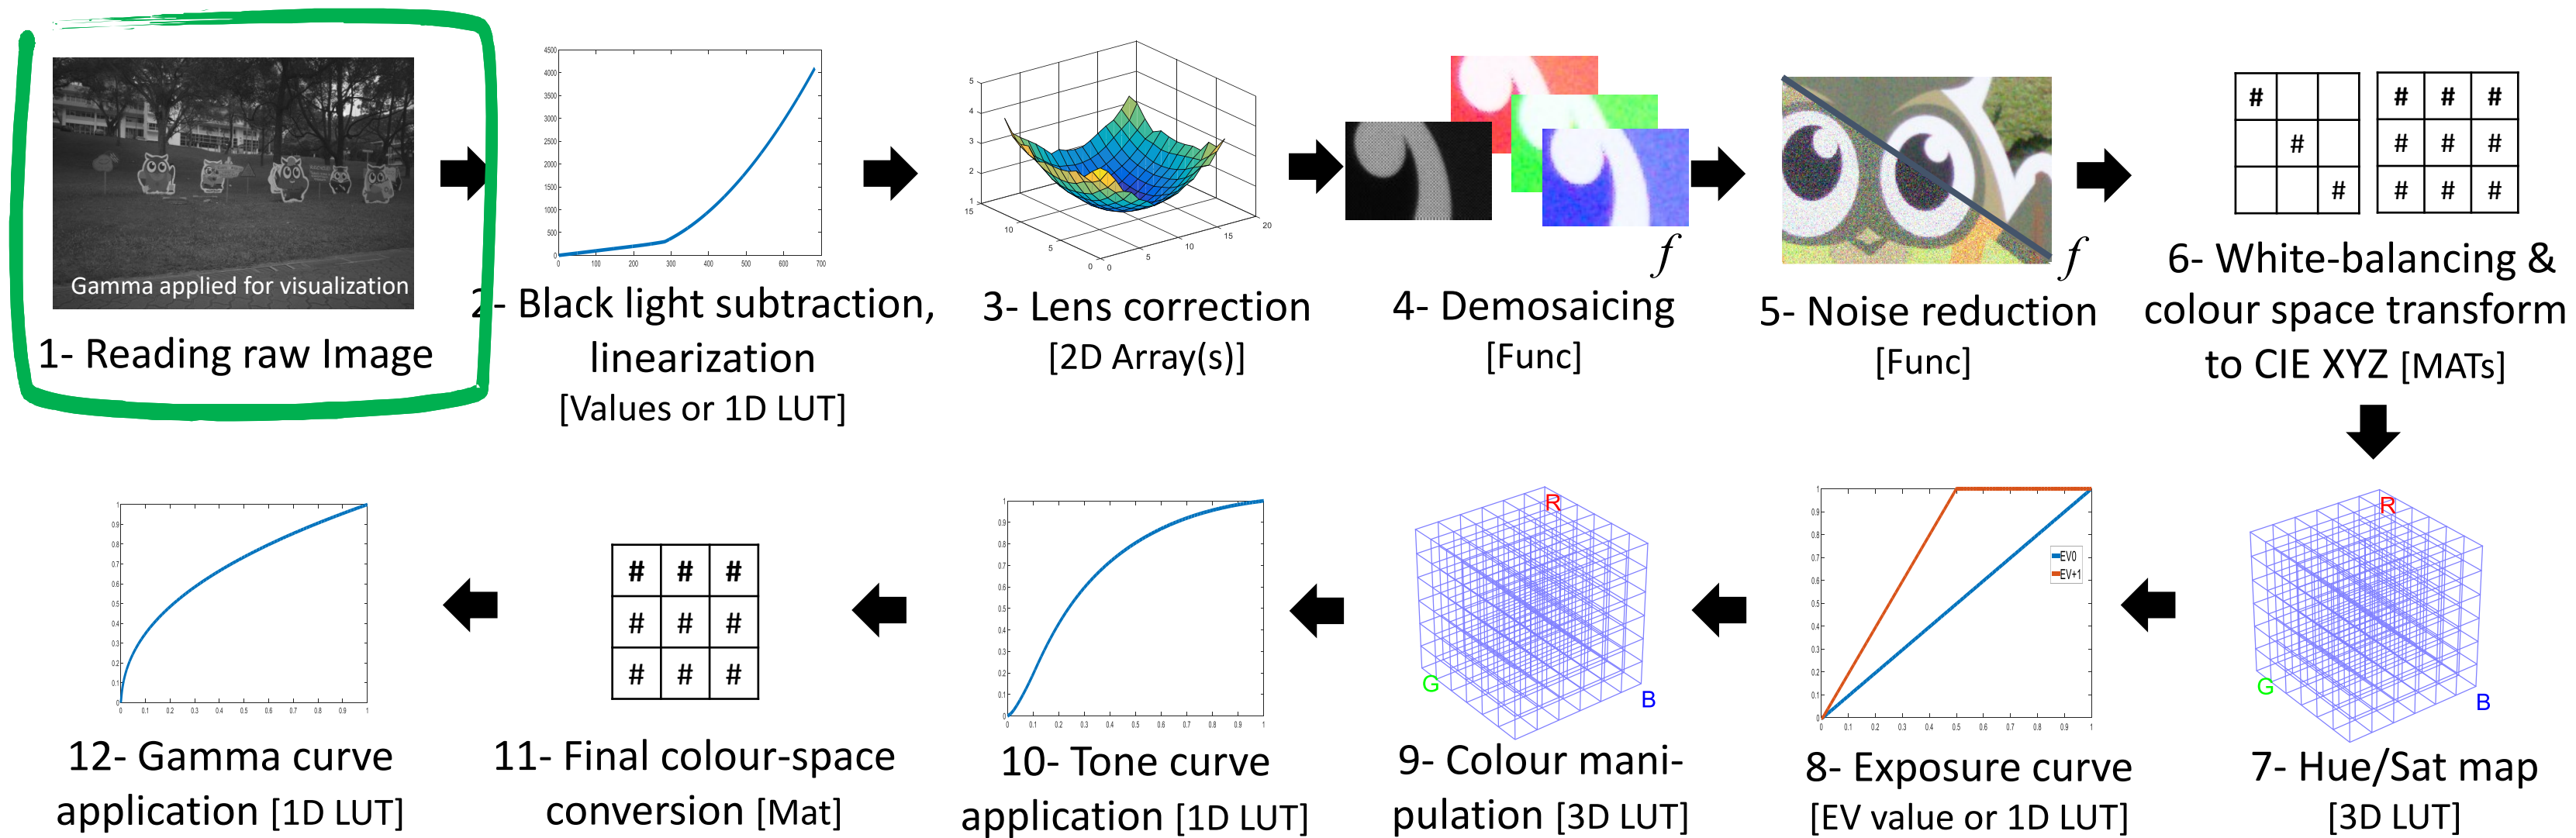

Digital cameras

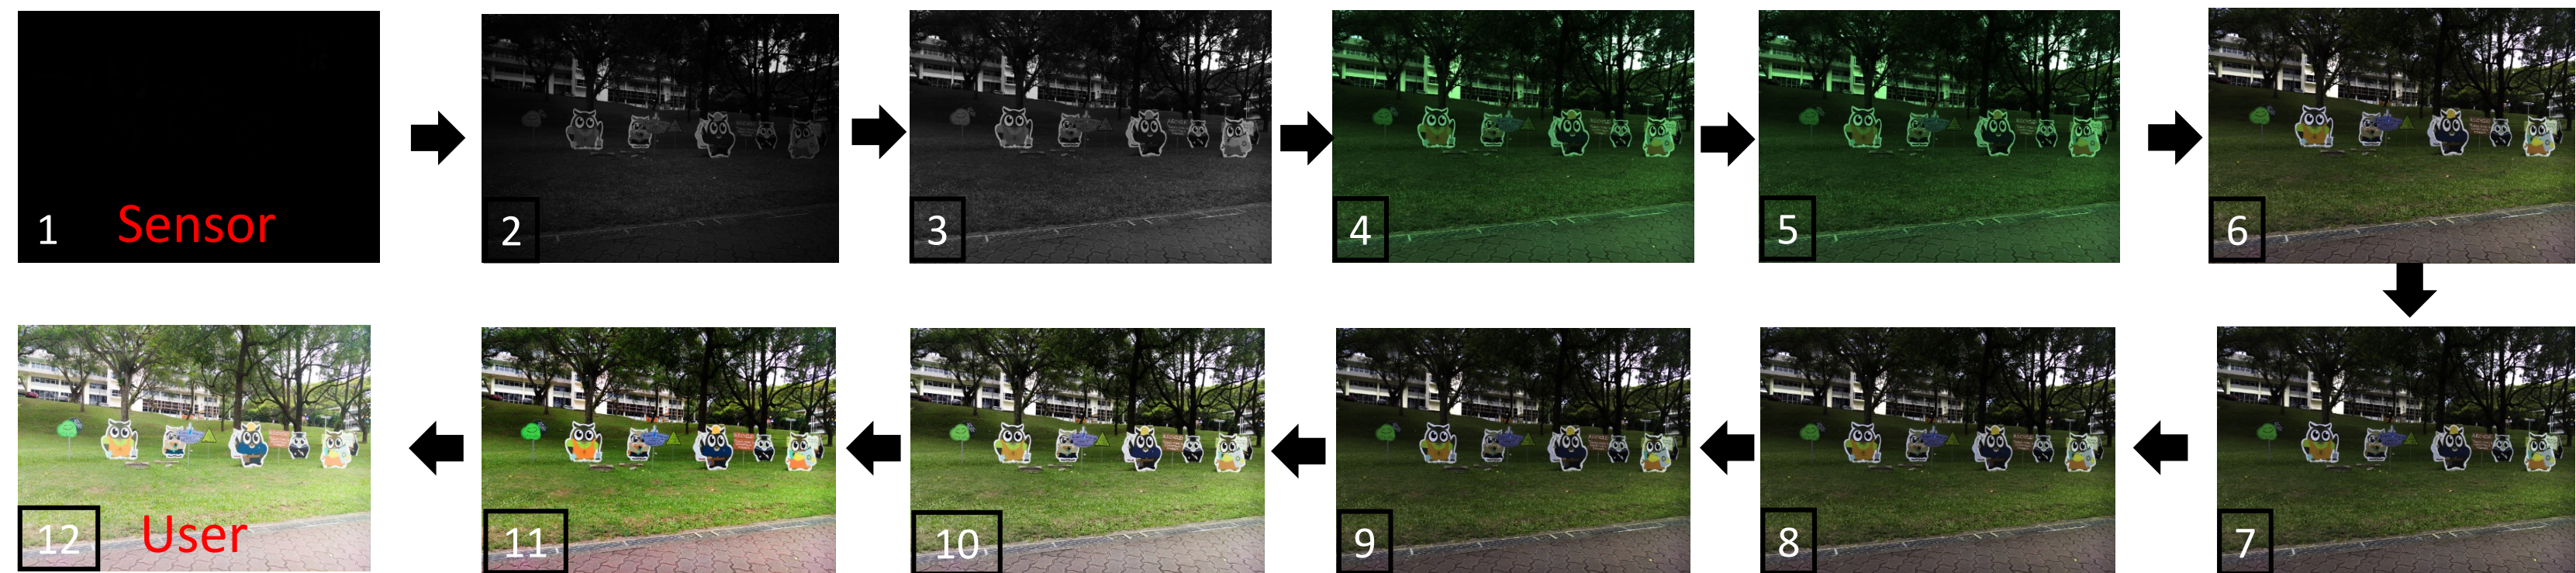

- Digital cameras are far from being light measuring devices
- They are designed to produce visually pleasing photographs
- There is a great deal of processing (photofinishing) happening on the camera

The goal of this lab session is to discuss common processing steps that take place onboard consumer cameras

White balancing & color space conversion

Colour cast correction

- If we can observe the colour of the illumination, we can correct it with a simple diagonal matrix.

$$\begin{bmatrix} R' \\ G' \\ B' \end{bmatrix} = \begin{bmatrix} R_{white}/R & 0 & 0 \\ 0 & G_{white}/G & 0 \\ 0 & 0 & B_{white}/B \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix}$$

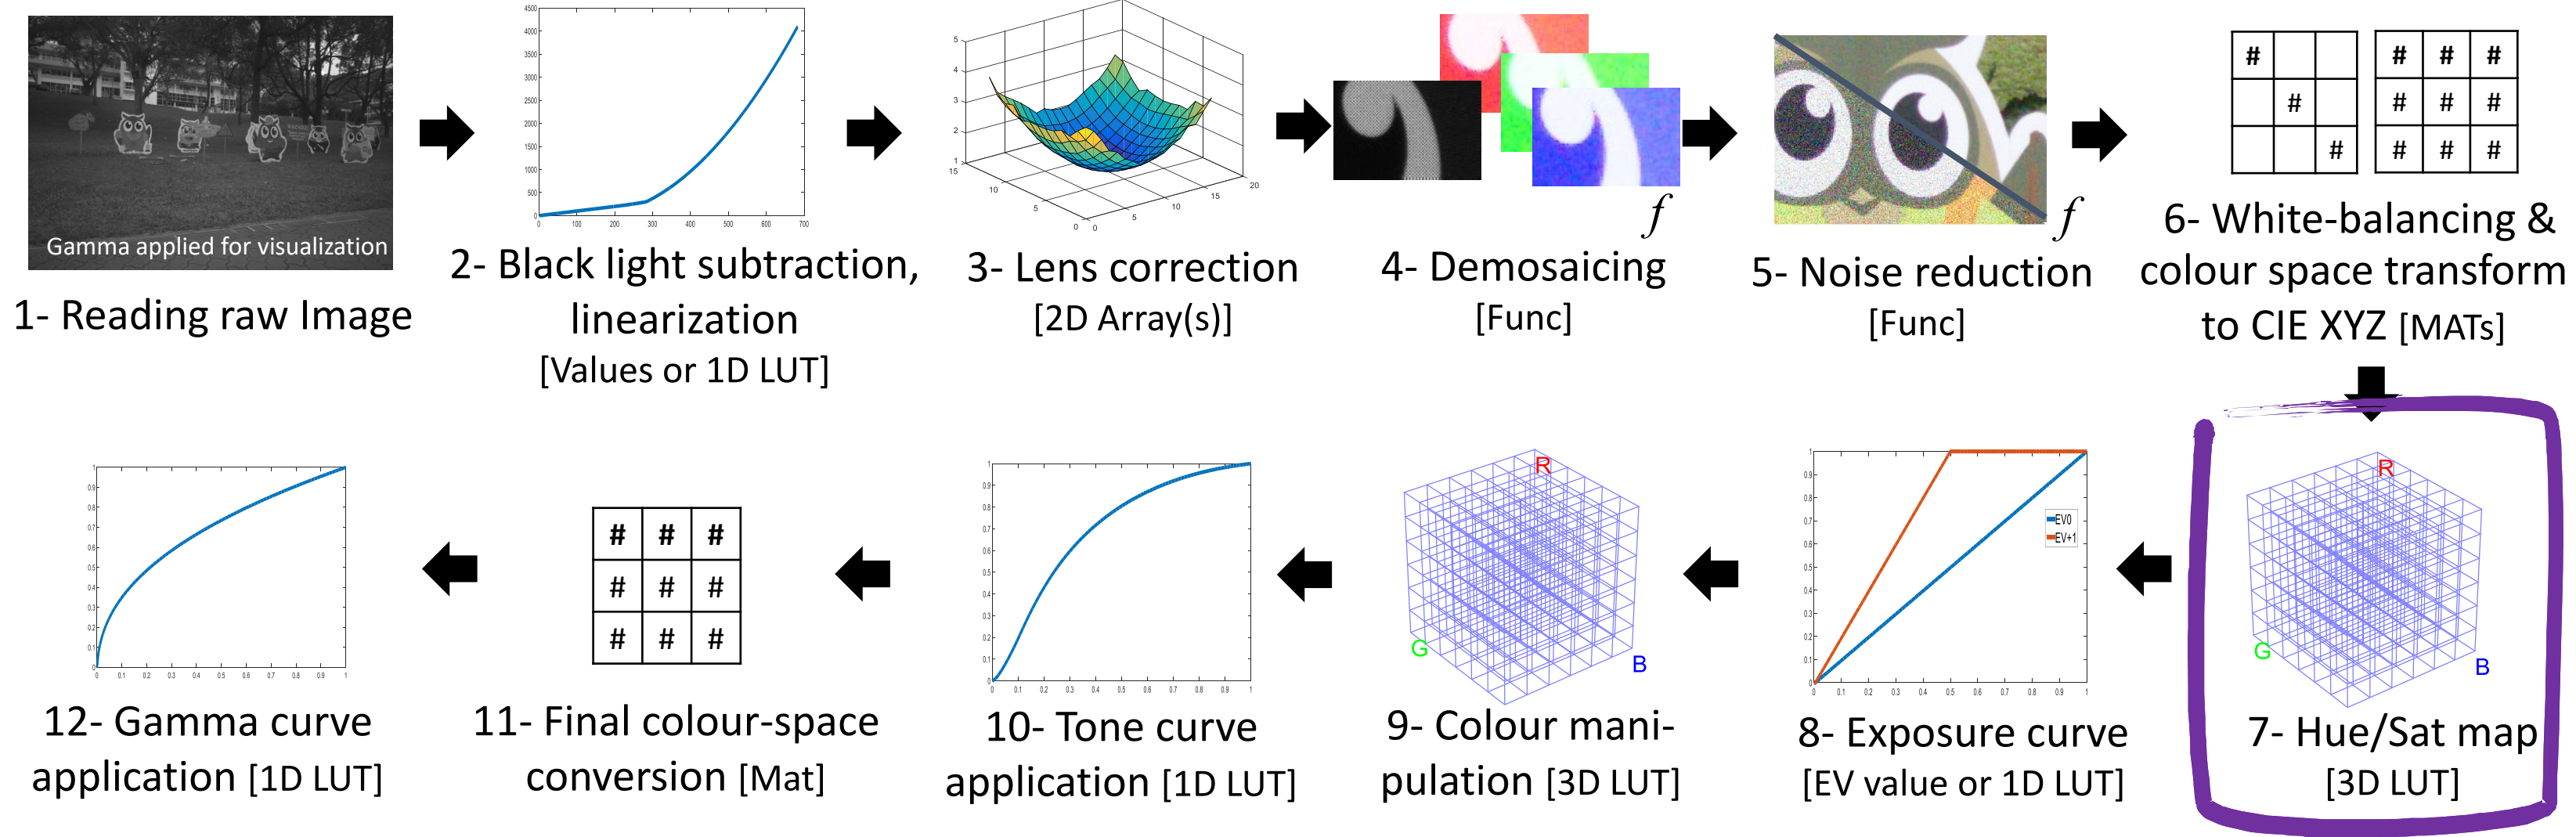

- This is known as “white-balance” since it ensures **white** is corrected

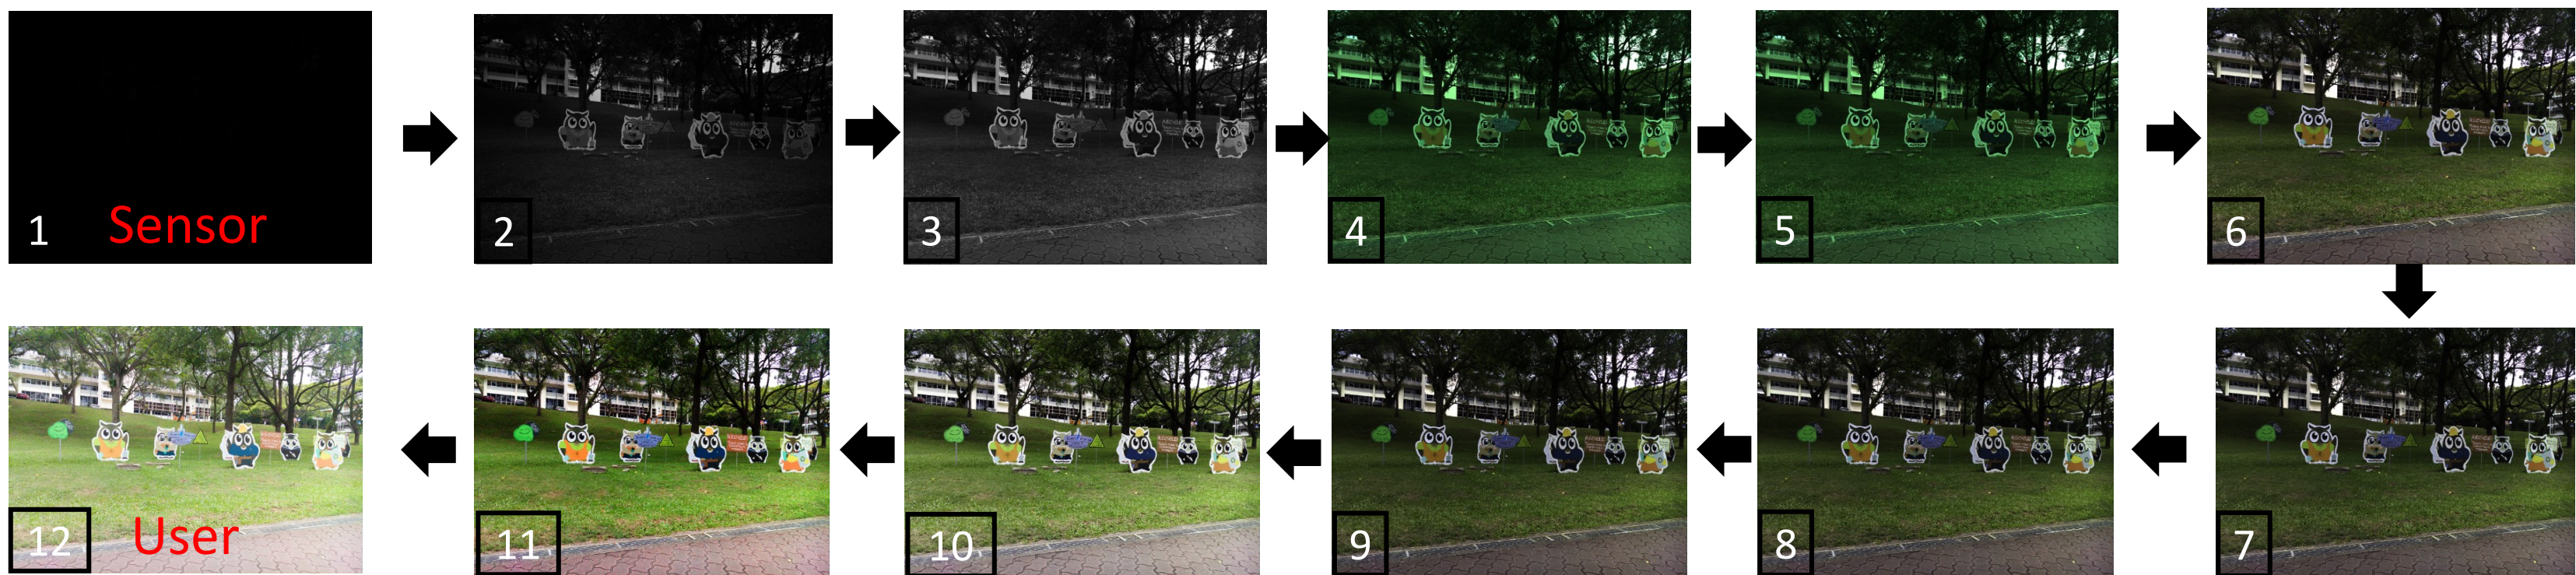

Illuminant's
colour

After the illuminant is divided out, we are sure about white is correct.
