

# CSE2031 Software Tools - Memory Allocation and Structures

Summer 2010

Przemyslaw Pawluk

Department of Computer Science and Engineering  
York University  
Toronto

May 25, 2010

Notes

---

---

---

---

---

---

---

---

## What have we done last time?

- Arrays
- Pointers

Notes

---

---

---

---

---

---

---

---

## What we will do today?

- 1 Pointers review
- 2 Dynamic memory allocation
- 3 Structures

Notes

---

---

---

---

---

---

---

---

## What do we know about pointers?

### Notes

---

---

---

---

---

---

---

---

## Problem

```
1 int x;  
2 scanf("%d", &x);  
3 int my_array[x];
```

How can we allocate memory during run time?

The code above is incorrect!

### Notes

---

---

---

---

---

---

---

---

## Solution

Use functions from `stdlib.h`

### Notes

---

---

---

---

---

---

---

---

## malloc()

```
void *malloc(int n);
```

- Allocate memory at run time.
- Returns a pointer to a void if successfully allocated n bytes in the memory
- Returns null if the memory was not allocated.
- The memory block is not initialized.

## Notes

---

---

---

---

---

---

---

## calloc()

```
void *calloc(int n, int s);
```

- Allocates an array of n elements where each element has size s;
- calloc initializes memory to 0.

## Notes

---

---

---

---

---

---

---

## realloc()

```
void * realloc(void *ptr, int n);
```

- What if we want our array to grow (or shrink)
- Resizes a previously allocated block of memory.
- ptr must have been returned from either calloc, malloc, or realloc.
- Array may be moved if it could not be extended in its current location.

## Notes

---

---

---

---

---

---

---

## free()

```
1 void free(void *ptr)
```

- Releases the memory we previously allocated.
- ptr must have been returned by malloc, alloc, or realloc.

## Notes

---

---

---

---

---

---

---

## Dynamic allocation - troubles

```
1 main() {  
2   int *x;  
3   int size;  
4   x=(int*) malloc(size);  
5   *x = 20; /* What is wrong? */  
6 }
```

## Notes

---

---

---

---

---

---

---

## Memory leaks

```
1 int *x;  
2 x=(int *) malloc(20);  
3 x=(int *) malloc(30);  
4 /* What's wrong?*/
```

Memory block allocated in line 2 is lost for ever.  
MAY cause problems (exhaust memory).

## Notes

---

---

---

---

---

---

---

## Inappropriate use of freed memory

```
1 char *x;  
2 x=(char *) malloc(50);  
3 free(x);  
4 x[0]= A ;
```

### Surprise

Surprisingly this code may work on some systems, but in general we cannot predict the result.

Notes

---

---

---

---

---

---

---

---

## Other issues with freed memory

### Freeing unallocated memory

```
1 char *x=NULL;  
2 free(x);
```

### Freeing "not yours" block

```
1 x=malloc(50);  
2 free(x+1);
```

### Double freeing

```
1 x=malloc(50);  
2 free(x);  
3 free(x);
```

Notes

---

---

---

---

---

---

---

---

## Structures

```
1 struct {  
2     float width;  
3     float height;  
4 } chair, table;
```

```
1 struct dimensions {  
2     float width;  
3     int height;  
4 };
```

Notes

---

---

---

---

---

---

---

---

## Access and pointers

- Accessing the members is done via '.' operator
- Structs cannot be assigned
- &chair is the address of the variable chair of type struct

19 / 35

Notes

## Namespaces

- struct names have their own namespace separate from variables and functions;
- struct member names have their own namespace.

```
1 struct dimesnion {  
2   float width;  
3   float height;  
4 } height;  
5 struct dimension dimension;
```

20 / 35

Notes

## Structures and Pointers

### Precedence of '!'

```
1 struct simension table, *p;  
2 p= &table;  
3 *p.width /* INCORRECT */  
4 (*p).width; /* CORRECT */
```

You can use '→' operator to access a structure's fields

```
1 p->width;
```

21 / 35

Notes

## Initialization of Structures

```
1 struct dimension sofa={2.0, 3.0};
```

Notes

---

---

---

---

---

---

---

## Nested Structures

```
1 struct point {int x, int y;};  
2 struct line {  
3     struct point a;  
4     struct point b;  
5 } myline;
```

Notes

---

---

---

---

---

---

---

## Structures and functions

- You can pass structure as arguments of functions
- This is a call-by-value, a copy of the structure is sent to the function

```
1 float get_area(struct dimension d) {  
2     return d.width * d.height;  
3 }
```

- Structure can be returned from function

```
1 struct dimension make_dim(int width, int height) {  
2     struct dimension d;  
3     d.width = width;  
4     d.height = height;  
5     return d;  
6 }
```

Notes

---

---

---

---

---

---

---

## Structures and Functions cont.

- It is inefficient to pass large structures to functions, instead use pointers and you can manipulate the same structure.
- Be careful when passing argument using pointer since the pointee is not a copy!

### Notes

---

---

---

---

---

---

---

## typedef

We can define a new type and use it later

```
1 typedef struct {  
2     int x,y;  
3     float z;  
4 } newtype;  
5 newtype a1,b1,c1,x;
```

Now, newtype can be used just like int, float and any other type in C

### Notes

---

---

---

---

---

---

---

## Complex structures – Linked list

Specification:

- Pointer head points to the first element
- Last element pointer is NULL

```
1 struct list {  
2     int data;  
3     struct list *link;  
4 };  
5 struct list *head
```

It is OK to use a pointer to a struct that is declared but not defined

### Notes

---

---

---

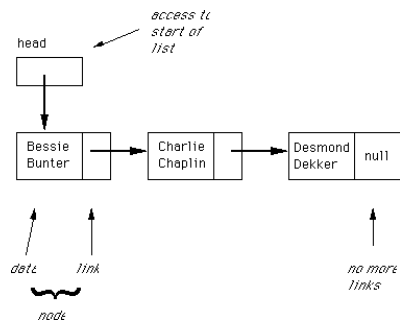

---

---

---

---

## Notes

---

---

---

---

---

---

---

---

## Add new node at the end of the list

- Allocate new node.
- Start with head and find the end of the list.
- Assign last link to point to the new node.

## Notes

---

---

---

---

---

---

---

---

## Delete element from the end of the list

- Find the node before the last node.
- Store the address to the last element in the variable.
- Assign NULL to the link field of the element before last.
- Free the element pointed by variable.

## Notes

---

---

---

---

---

---

---

---

## Delete ith element from the list

- Find the i-1 node.
- Store the address to the last element in the variable.
- Assign link of the ith element to the link field of the i-1 element to keep the tail of the list.
- Free the element pointed by variable.

### Notes

---

---

---

---

---

---

---

## Complex structures – Tree

### Specification:

- Each node has up to 2 child nodes
- Each node has 1 parent node
- There is only one element that has no parent node – root node

```
1 struct tree {  
2     int data;  
3     struct list *lchild;  
4     struct list *rchild;  
5 };  
6 struct list *root
```

### Notes

---

---

---

---

---

---

---

### Notes

---

---

---

---

---

---

---

## What we did today

- 1 Pointers review
- 2 Dynamic memory allocation
- 3 Structures

### Notes

---

---

---

---

---

---

---

---

## Next time

- Unions
- Enumerations
- Review of what we did so far.
