## High-level access

#### CSE2031 Software Tools -System Calls, Processes

Przemyslaw Pawluk

#### Files - review

- Processes
- Low-level process creation Control of process

Filters

#### Methods

- fopen opens a file and returns a pointer to FILE structure
- fclose closes a file (also writes a buffer content if any)
- fflush writes a buffer into a file
- read
  - getc reads one char from the input file
  - fscanf reads input from file like scanf
- write
  - putc prints a char into file (buffered)
  - fprintf prints a formatted string into a file

### Low-level access

Przemyslaw Pawluk

#### Files - review

#### Processes

Low-level process creation Control of process

Filters

#### Methods

- fopen opens a file and returns file descriptor
- create closes a file (also writes a buffer content if any)

- read reads n bytes form file into a buffer
- write writes *n* bytes form buffer into a file

### How to call a program from another program?

C allows us to call a program from our code (without returning) by two commands execlp and execvp.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

CSE2031 Software Tools -System Calls, Processes Przemysław Pawluk

## execlp

execlp(PATH, PROGNAME, ARGS ...);

Files - review Processes

Low-level process creation

Control of process

Filters

• ARGS are subsequent command line arguments where the last one is NULL (0)

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ の ○ ○

```
execlp("date", "date", (char *) 0);
```

PATH is a path containing a program name

• PROGNAME is a first element of the argv array

#### execvp

CSE2031 Software Tools -System Calls, Processes

Przemyslaw Pawluk

Processes

Low-level process creation

Control of process

Filters

Works exactly the same way, however accepts a array or arguments, so you do not need to know a number of arguments in advance.

## How it works?

```

5

### Execute and get the control back

fork allows us to call a program and regain control after running a program with  $\ensuremath{\mathsf{execlp}}\xspace/$ 

#### How to use it?

```
int procid = fork();
if(procid==-1){
    error("cannot_create_child_process");
    exit(-1);
```

/\* Parent can do something or wait for a child =
wait(&status);

## wait and status

CSE2031 Software Tools -System Calls, Processes

Przemyslaw Pawluk

Files - review

Processes Low-level process creation

Control of process

Filters

### wait(&status);

- wait makes parent to wait for a result from child
- status encodes eight bits (low-order) an exit status of child where 0 mean normal termination and non-zero some kind of error

Files - review

Processes

Low-level process creation

Control of process

Filters

### This is not covered by any of our textbooks!

The signals are defined in the include file <signal.h>.

SIGABRT – Abnormal termination, such as instigated by the abort function. (Abort.)

SIGFPE - Erroneous arithmetic operation, such as divide by 0 or overflow. (Floating point exception.)

SIGILL – An invalid object program has been detected. This usually means that there is an illegal instruction in the program. (Illegal instruction.)

 ${\tt SIGINT}$  – Interactive attention signal; on interactive systems this is usually generated by typing some break-in key at the terminal. (Interrupt.)

SIGSEGV – Invalid storage access; most frequently caused by attempting to store some value in an object pointed to by a bad pointer. (Segment violation.)

SIGTERM - Termination request made to the program. (Terminate.)

## Send and receive signals

FIOCESSES

Low-level process creation

• Control of process

## What is a filter in Unix?

CSE2031 Software Tools -System Calls, Processes

Przemyslaw Pawluk

Files - review

Processes Low-level process creation Control of process

Filters

Filter is a program that has following properties:

• Read text input line by line (from stdin by default)

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ の ○ ○

- Perform some transformation
- Write some output (to stdout by default)

## What can we do with filters?

- Software Tools -System Calls, Processes
- Przemyslaw Pawluk
- Files review
- Processes Low-level process creation Control of process
- Filters

• Filters are very common tools in Unix-like systems. Many standard commands are actually filters (grep, cut etc.).

イロト 不得下 不良下 不良下

3

• Filters can work together as parts of pipes

grep pawluk marks.txt | cut -f4

## How to write a filter in C

CSE2031 Software Tools -System Calls, Processes

Przemyslaw Pawluk

Files - review

Processes Low-level process creation Control of process

Filters

Your program should do following things:

- Process the stdin line by line
- Do some transformations based on the input read

◆ロト ◆昼 ト ◆臣 ト ◆臣 ト ○日 ○ のへで

- Write output to the stdout
- Write any errors into stderr

## Example

process Filters

#### Reverse

Let's write a filter that reverses a word in the stdin and writes result to the stdout. We will call it reverse.
