Commands
Overview

grep family

The AWK
Programming
Language

Our goal is to see how we can use Unix as a tool for developing programs

- Each running program on a Unix system is called a process
- Processes are identified by a number (process id or PID)
- Usually many processes running simultaneously
- Each process has a unique PID

- Every process has a current working directory
- In a shell, the command `ls` shows the contents of the current working directory
- `pwd` shows the current working directory
- `cd` changes the current working directory

- A *path name* is a reference to something in the filesystem
- A path name specifies the set of directories you have to pass through to find a file
- Directory names are separated by '/' in Unix
- Path names beginning with '/' are absolute path names.
- Path names that do not begin with '/' are relative path names (Start search in current working directory)

Introduction
to UNIX

UNIX Shells

Commands
Overview

grep family

The AWK
Programming
Language

- . means "the current directory"
- .. means "the parent directory"
- ~ means "home directory"

Try

```
1 ls .
2 ls ..
3 ls ~
```

- `/dev` contains devices
- Look like files but really communicate with devices.

For example:

- `/dev/tty` the terminal (or virtual terminal) you are currently using
- `/dev/zero` an input stream which returns an endless stream of null bytes (`'\0'`)
- `/dev/null` the bitbucket discards any input, generates no output (empty)

Use of dev/null

Introduction
to UNIX

UNIX Shells

Commands
Overview

grep family

The AWK
Programming
Language

To discard stdout of a command:

```
cat hello.c >/dev/null
```

To provide no input to a command:

```
cat </dev/null
```

5 The AWK Programming Language

What is shell?

Ordinary program which acts as a command interpreter and offers multiple benefits including

- Filename shorthand
- I/O redirection
- Personalizing the environment
- Programming language

- There are many programs which are shells
- The most common Unix shells are:
 - Bourne shell (sh)
 - C shell (csh)
 - Korn shell (ksh)
 - Also: Bourneagain shell (bash).
- In this course we are mostly concerned with the Bourne shell (sh)

How does it work?

Language

When a command is entered shell does

- Process metacharacters
- Command line substitution
- Command execution

grep family

The AWK
Programming
Language

- > >> < | – IO redirection
- * ? [...] – Filename shorthand
- 'command' – Command substitution
- || && – Conditional execution
- (...) – Group commands
- & – Background processing
- <<to k – Here document
- \$ – Expand value
- \ # ; – Escape, comment, terminator
- ' " – Single/double quotes

Introduction
to UNIX

UNIX Shells

Commands
Overview

grep family

The AWK
Programming
Language

- `ls` list directory content
- `cp` file copy
- `mv` file renaming, moving
- `rm` delete files
- `mkdir` create a new directory
- `cd` change directory
- `pwd` print current working directory
- `cat` print text files
- `more` print text files page by page
- `less` view text files
- `head` print first part of a text file
- `tail` print last part of a text file

Basic Unix Commands(2)

Introduction
to UNIX

UNIX Shells

Commands
Overview

grep family

The AWK
Programming
Language

- `expr` evaluate an expression
- `echo` display a line of text
- `date` print and set system date and time
- `ps` process status
- `kill` kill a process (send a signal)
- `top` display top CPU processes
- `od` octal dump of a file
- `du` disk usage
- `chmod` change file access permission
- `chgrp` change group ownership
- `ln` link files
- `diff` difference of two files
- `basename` base name of a full path name

UNIX Shells

Commands

Overview

grep family

The AWK

Programming

Language

If we just run a command, e.g. `wc` then the terminal is used for `stdin`, `stdout`, and `stderr` by default. However, we don't need to use the terminal. We can control what `stdin`, `stdout`, and `stderr` refer to.

The simple case is redirection using a file

```
wc <foo/bar/file
```

i.e. use the contents of the file `"foo/bar/file"` instead of the terminal for `stdin`

```
wc >foo/bar/file
```

i.e. put the output of `stdout` into `"foo/bar/file"` instead of the terminal

We can also redirect stdout or stdin to other programs (instead of files)

```
cat myfile | wc
```

this takes the stdout of the cat myfile command and makes it the stdin of the wc command

Introduction
to UNIX

UNIX Shells

Commands
Overview

grep family

The AWK
Programming
Language

A shell provides

- Basic interactive shell
- Programming environment

Filters are a large family of UNIX programs that:

- Read text input line by line
- Perform some transformation
- Write some output

Simple filters: `grep, cut, sort, uniq, tr`

```
$ grep 'tom' /etc/passwd
```

print lines containing 'tom'

Programmable filters: `awk, sed`

```
$ awk '/tom/ {print}' /etc/passwd
```

- Each processes argument files or stdin if arguments are missing
- Each writes to stdout. Arguments never specify stdout, unless there is an option (e.g. -o)
- Some optional arguments (l.e. options, -a -n ...) may precede input filename(s)
- Error messages are written to stderr

5 The AWK Programming Language

- `grep`: searches text files for pattern and prints all lines that contain that pattern
- `egrep` (expression `grep`): same as `grep` but supports full regular expressions
- `fgrep` (fast `grep`): searches for a string, instead of pattern

Prints out all lines in the input that match the given regular expression
`grep [options] pattern [file ...]`
e.g.

`grep hello`

Prints out all lines of stdin containing "hello"

Exit status

grep exits with a value:

- 0 if pattern found
- 1 if pattern not found
- 2 if file not found

Can be used in scripts!

Frequently Used Options

Introduction

to UNIX

UNIX Shells

Commands

Overview

grep family

The AWK

Programming

Language

- -i ignore case of letters (case insensitive search)
- -v invert search (print lines that dont match)
- -c displays count of matching lines
- -w search for expression as distinct word
- -n precede each line with line number
- -l list only input filenames where matches occur
- -h do not display filenames
- -s work silently (suppress error messages)

Introduction
to UNIX

UNIX Shells

Commands
Overview

grep family

The AWK
Programming
Language

- A regular expression is a special string (like a wildcard pattern)
- A compact way to represent text patterns
- A compact way of matching several text lines with a single string
- Provide a mechanism to select specific strings from a set of character strings

Basic RE vs. Extended RE

Basic

Letters and numbers are literal that is they match themselves:

e.g. "foobar" matches "foobar"

'.' matches any single character (i.e. exactly one)

[xyz] matches any character in the set (ranges via '-')

[^xyz] matches any character not in the set

'*' matches 0 or more occurrences of last char

'?' matches 0 or 1 occurrences of last char

'+' matches 1 or more occurrences of the last char

'^' matches the beginning of the line

'\$' matches the end of the line

"\<" and "\>" match begin and end of a word

\{n\} matches exactly n occurrences

\{n,\} matches at least n occurrences

\{n,m\} matches occurrences between n and m

```
grep -v '^#'!
```

Removes all lines beginning with '#'

```
grep -v '^[ ]*$'!
```

Removes all lines which are either empty or contain only spaces (all empty lines)

```
ls -l | grep "^[^d]"!
```

List only files that are not directories

Like `grep`, `fgrep` searches for things but does not do regular expressions just fixed strings.

```
fgrep 'hello.*goodbye'
```

Searches for string "hello.*goodbye" does not match it as a regular expression

- Used to split lines of a file
- A line is split into fields
- Fields are separated by delimiters
- A common case where a delimiter is a space or tab character
- Default delimiter is tab

Syntax

```
cut [-ffields] [-ccolumns] [-dcharacter] [filename ...]
```

- sorts lines in a file
- Like before, if no files are given, sorts stdin and writes result to stdout
- By default sorts lines in ascending alphabetical order

Syntax

```
sort [options ... ] [file ... ]
```

- `-r` sort in reverse order (descending)
- `-n` treat each line as a number and sort numerically
- `-kN` sort based on the Nth field, e.g. `-k2` or `-k4`
- `-t`: specify field separator (default space and tab)

Removes repeated lines in a file

Syntax

```
uniq [-c] [input [output]]
```

Notice difference in args:

- 1st filename is input file
- 2nd filename is output file
