

Digital Logic Design

Chapter 1 Introduction

Fall 2011

CSE3201

1

Introduction

- This course is about Design Techniques for **Digital System**, a more exact name will be **Synchronous Digital Hardware System**.
- Synchronous means clocked i.e. all changes in the system are controlled by a global clock and happen at the same time
- Digital means all values (input, output, and internal) can take on discrete values.
- A/D if the input is analog (voice or music).

CSE3201

3

Course contents

- Number system and how to represent things digitally.
- Boolean algebra and logic circuits.
- Combinational design
- Sequential design
- This is not a course on transistor physics or circuits, but we need to know these to better understand the building blocks of the system.
- Not a course on computer organization, but we will look at these as example of what we can do

Fall 2011

CSE3201

4

Good Design

- Digital systems are very complex and large, in order to do a good design, consider these issues:
 - Modularize your design
 - Top-down Design
 - Bottom-up Design
- Design issues: **Speed, Cost, Power**
- Usually these are contradictory (a fast system is not cheap).
- Design is more of an art than science, but luckily we have measures for the design (cost, speed, .)

Fall 2011

CSE3201

5

Specifications

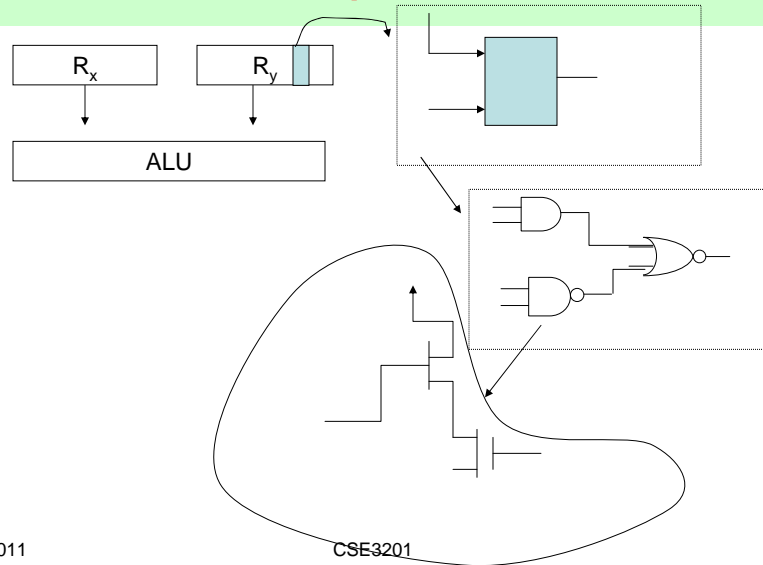

- Like in any other design, we start with the specification.
- The specification is basically what do we want to achieve.
 - High level specification
 - Binary level specification
 - Algorithmic level specification

Fall 2011

CSE3201

6

Level of Implementation

Fall 2011

CSE3201

7

CAD TOOLS

- Nowadays, design is usually automated, we use design tools for our design.
- HDL is used to describe the system (or the proposed system) in a high-level C-like language.
- Synthesis tools are used to map this design to FPGA
- Simulation tools are used to check the design (timing or functional simulation).
- Finally, testing

Fall 2011

CSE3201

8

Implementation

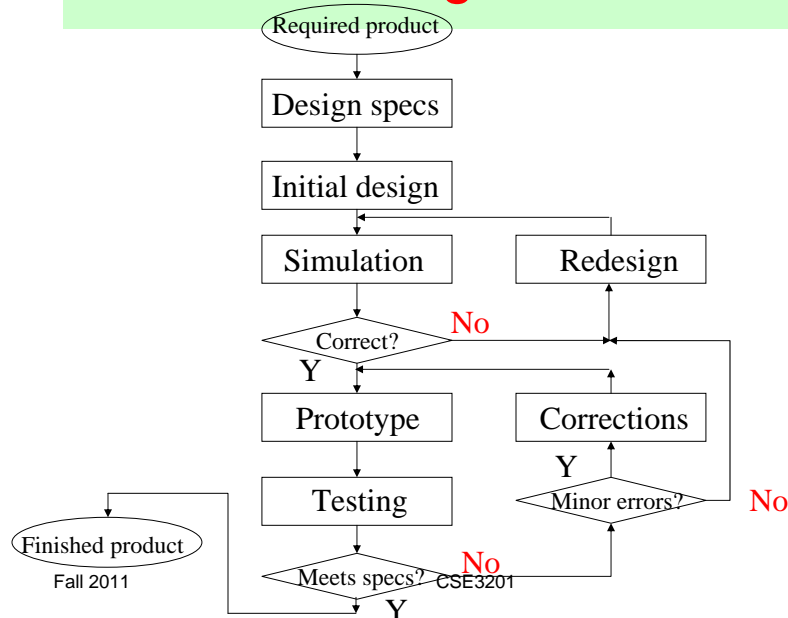

- Integrated Circuits (IC's)
 - Crystalline silicon
 - 1—100's of Millions of transistors
 - Feature size 0.13um or 0.13 90 n (0.09micron) 60n and dropping ...
 - CMOS (mostly)
 - Standard microprocessors
 - ASIC (application Specific IC's)
 - FPGA's (Field Programmable Gate Arrays)
- Printed Circuits Board (PCB)
 - Fiberglass or ceramics
 - Many conductive layers (1-20)
 - Multiple Chips Modules (MCM's) multiple chips directly connected to a substate
- Chassis

Fall 2011

CSE3201

9

The Design Process

10

Number System

- Decimal numbers
 $(9735) = 9 \times 10^3 + 7 \times 10^2 + 3 \times 10^1 + 5 \times 10^0$
- Binary numbers (1101)
 $= 1 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 = 13$ decimal
- How to convert 29 to binary (successive division by 2 the answer is 11101)

Number	Quotient	Remainder
29/2	14	1
14/2	7	0
7/2	3	1
3/2	1	1
1/2	0	1

Fall 2011

CSE3201

11

Number System

- Octal and Hex
- Conversion is the same idea

Fall 2011

CSE3201

12

Complements—Diminished radix

- Given a number N , in base r having n digits is defined as $(r^n - 1) - N$
- For example 9th complement of 456325 is

$$\begin{array}{r} 999999 \\ - 456325 \\ \hline 543674 \end{array}$$
- The 1's complement of any binary number is obtained by changing every 1 to 0 and every 0 to 1
- The 1's complement of 101100010 is

$$\begin{array}{r} 101100010 \\ 010011101 \end{array}$$

Fall 2011

CSE3201

13

Radix Complement

- Given a number N , in base r having n digits is defined as $r^n - N = (r^n - 1) - N + 1$
- For the 10th complement, the rule is
- Leave the least significant 0's unchanged, the first nonzero digit is subtracted from 10, the rest of the digit are subtracted from 9 10th complement of 3451600 is

$$\begin{array}{r} 10000000 \\ - 3451600 \\ \hline 6548400 \end{array}$$
- For 2's complement, the LSB zeros are left unchanged, the first 1 unchanged, the remaining bits are complemented

$$\begin{array}{r} 010010 \\ 110110 \end{array}$$

Fall 2011

CSE3201

14

Signed Binary Numbers

Decimal	2's complement	1's complement	signed magnitude
+7	0111	0111	0111
+6	0110	0110	0110
+5	0101	0101	0101
+4	0100	0100	0100
+3	0011	0011	0011
+2	0010	0010	0010
+1	0001	0001	0001
+0	0000	0000	0000
-0		1111	1000
-1	1111	1110	1001
-2	1110	1101	1010
-3	1101	1100	1011
-4	1100	1011	1100
-5	1011	1010	1101
-6	1010	1001	1110
-7	1001	1000	1111
-8	1000		

Fall 2011

CSE3201

15

Subtraction with complement

- To subtract two n -digit unsigned numbers $M-N$ in base r is done as follows
 1. Add the minuend M to the r 's complement of the subtrahend N yielding $M+(r^n - N) = M-N+r^n$
 2. If $M \geq N$ The sum will produce an end carry, that is basically the r^n
 3. If $M \leq N$ The sum does not produce a carry and is equal to $r^n - (N-M)$ which is the r 's complement of $(N-M)$. To obtain the answer take the r 's complement of the sum and place a -ve sign next to it.

Fall 2011

CSE3201

16

Addition (examples)

Fall 2011

CSE3201

17

Addition (Example)

Fall 2011

CSE3201

18

Binary Codes

- **BCD** Note that in adding 2 BCD numbers, the digits are added as if they are 2 binary numbers, if the result is greater than or equal 1010, we add 0110 to obtain the correct BCD digit sum and a carry
- **Gray code** (why do we care?)
- **ASCII** and ASCII with parity

Fall 2011

CSE3201

19

BCD Addition

Fall 2011

CSE3201

20

Gray Codes

- Only 1 digit change when we go from any number to number+1
- To form a sequence, put the sequence from left to right, followed by the sequence reversed. Add 0 as a MSB to the left sequence and 1 to the right sequence

0	1						
00	01	11	10				
000	001	011	010	110	111	101	100
0	1	3	2	6	7	5	4

Fall 2011

CSE3201

21

Register Transfer Logic

- Example $R2 \rightarrow R1$
- What is an R?

Fall 2011

CSE3201

22

Binary Logic

- Low 0-1 volt
- High 1.2-4 volts
- In-between not defined
- AND, OR NOT (EXOR, NAND, NOR)
