Motion Models (cont)

- suppose that a robot has a map of its environment and it needs to find its pose in the environment
 - this is the robot localization problem (Chapter 7)
 - several variants of the problem
 - the robot knows where it is initially
 - the robot does not know where it is initially
 - kidnapped robot: at any time, the robot can be teleported to another location in the environment
- a popular solution to the localization problem is the particle filter (Chapter 4)
 - uses simulation to sample the state density $p(x_t | u_t, x_{t-1})$

2/13/2012

- sampling the conditional density is easier than computing the density because we only require the forward kinematics model
 - given the control u_t and the previous pose x_{t-1} find the new pose x_t

3 2/13/2012

Eqs 5.7, 5.8

$$\begin{pmatrix} x' \\ y' \\ \theta' \end{pmatrix} = \begin{pmatrix} x_c + \frac{v}{\omega}\sin(\theta + \omega\Delta t) \\ y_c - \frac{v}{\omega}\cos(\theta + \omega\Delta t) \\ \theta + \omega\Delta t \end{pmatrix}$$

$$= \begin{pmatrix} x \\ y \\ \theta \end{pmatrix} + \begin{pmatrix} -\frac{v}{\omega}\sin\theta + \frac{v}{\omega}\sin(\theta + \omega\Delta t) \\ \frac{v}{\omega}\cos\theta - \frac{v}{\omega}\cos(\theta + \omega\Delta t) \\ \omega\Delta t \end{pmatrix}$$
Eqs 5.9

^{*}we already derived this for the differential drive!

as with the original motion model, we will assume that given noisy velocities the robot can also make a small rotation in place to determine the final orientation of the robot

$$\begin{pmatrix} x' \\ y' \\ \theta' \end{pmatrix} = \begin{pmatrix} x \\ y \\ \theta \end{pmatrix} + \begin{pmatrix} -\frac{\hat{v}}{\hat{\omega}}\sin\theta + \frac{\hat{v}}{\hat{\omega}}\sin(\theta + \hat{\omega}\Delta t) \\ \frac{\hat{v}}{\hat{\omega}}\cos\theta - \frac{\hat{v}}{\hat{\omega}}\cos(\theta + \hat{\omega}\Delta t) \\ \hat{\omega}\Delta t + \hat{\gamma}\Delta t \end{pmatrix}$$

6 2/13/2012

1: Algorithm sample_motion_model_velocity(
$$u_t, x_{t-1}$$
):

2:
$$\hat{v} = v + \mathbf{sample}(\alpha_1 \ v^2 + \alpha_2 \ \omega^2)$$

3:
$$\hat{\omega} = \omega + \mathbf{sample}(\alpha_3 \ v^2 + \alpha_4 \ \omega^2)$$

4:
$$\hat{\gamma} = \mathbf{sample}(\alpha_5 \ v^2 + \alpha_6 \ \omega^2)$$

5:
$$x' = x - \frac{\hat{v}}{\hat{\omega}}\sin\theta + \frac{\hat{v}}{\hat{\omega}}\sin(\theta + \hat{\omega}\Delta t)$$

6:
$$y' = y + \frac{\hat{v}}{\hat{\omega}}\cos\theta - \frac{\hat{v}}{\hat{\omega}}\cos(\theta + \hat{\omega}\Delta t)$$

7:
$$\theta' = \theta + \hat{\omega}\Delta t + \hat{\gamma}\Delta t$$

8: return
$$x_t = (x', y', \theta')^T$$

- the function $sample(b^2)$ generates a random sample from a zero-mean distribution with variance b^2
 - ▶ Table 5.4 has two algorithms you could use
 - Matlab is able to generate random numbers from many different distributions
 - help randn
 - help stats

2/13/2012

How to Sample from Normal or Triangular Distributions?

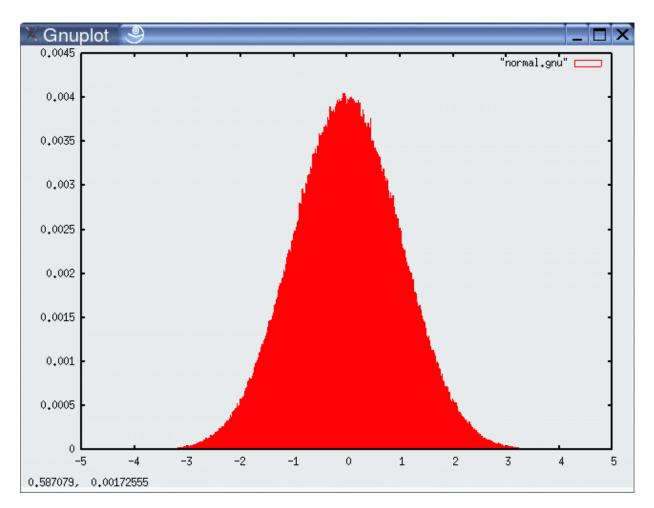

- Sampling from a normal distribution
 - I. Algorithm **sample_normal_distribution**(*b*):

2. return
$$\frac{1}{2} \sum_{i=1}^{12} rand(-b, b)$$

- Sampling from a triangular distribution
 - I. Algorithm **sample_triangular_distribution**(*b*):

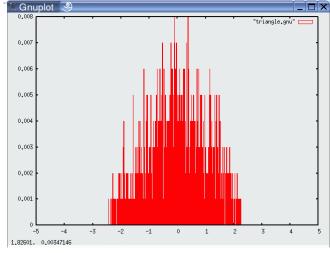

2. return
$$\frac{\sqrt{6}}{2} \left[\operatorname{rand}(-b, b) + \operatorname{rand}(-b, b) \right]$$

Normally Distributed Samples

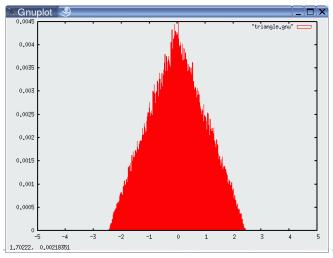

10⁶ samples

For Triangular Distribution

Rejection Sampling

Sampling from arbitrary distributions

```
1. Algorithm sample_distribution(f,b):
2. repeat
3. x = \operatorname{rand}(-b, b)
4. y = \operatorname{rand}(0, \max\{f(x) \mid x \in (-b, b)\})
5. until (y \leq f(x))
6. return x
```

Examples

2/13/2012

Odometry Motion Model

- many robots make use of odometry rather than velocity
- odometry uses a sensor or sensors to measure motion to estimate changes in position over time
- typically more accurate than velocity motion model, but measurements are available only after the motion has been completed
- technically a measurement rather than a control
 - but usually treated as control to simplify the modeling
- odometry allows a robot to estimate its pose
 - but no fixed mapping from odometer coordinates and world coordinates

in wheeled robots the sensor is often a rotary encoder

14 2/13/2012

Example Wheel Encoders

These modules require +5V and GND to power them, and provide a 0 to 5V output. They provide +5V output when they "see" white, and a 0V output when they "see" black.

These disks are manufactured out of high quality laminated color plastic to offer a very crisp black to white transition. This enables a wheel encoder sensor to easily see the transitions.

Odometry Model

bar indicates odometer coordinates

Robot moves from

$$\langle \overline{x}, \overline{y}, \overline{\theta} \rangle$$
 to $\langle \overline{x}', \overline{y}', \overline{\theta}' \rangle$.

Odometry information

$$u = \langle \delta_{rot1}, \delta_{rot2}, \delta_{trans} \rangle$$

trans

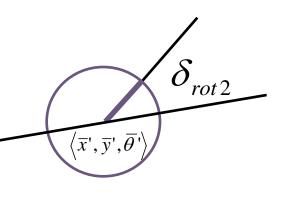

$$\delta_{trans} = \sqrt{(\overline{x}' - \overline{x})^2 + (\overline{y}' - \overline{y})^2}$$

$$\delta_{rot1} = \operatorname{atan2}(\overline{y}' - \overline{y}, \overline{x}' - \overline{x}) - \overline{\theta}$$

$$\delta_{rot2} = \overline{\theta}' - \overline{\theta} - \delta_{rot1}$$

$$\delta_{rot1} = \operatorname{atan2}(\overline{y}' - \overline{y}, \overline{x}' - \overline{x}) - \overline{\theta}$$

$$\delta_{rot2} = \overline{\theta}' - \overline{\theta} - \delta_{rot1}$$

$$\langle \overline{x}, \overline{y}, \overline{\theta} \rangle$$
 δ_{rot1}

Noise Model for Odometry

The measured motion is given by the true motion corrupted with noise.

$$\begin{split} \hat{\delta}_{rot1} &= \delta_{rot1} - \mathcal{E}_{\alpha_1 \, \delta_{rot1}^2 + \alpha_2 \, \delta_{trans}^2} \\ \hat{\delta}_{trans} &= \delta_{trans} - \mathcal{E}_{\alpha_3 \, \delta_{trans}^2 + \alpha_4 \, \delta_{rot1}^2 + \delta_{rot2}^2} \\ \hat{\delta}_{rot2} &= \delta_{rot2} - \mathcal{E}_{\alpha_1 \, \delta_{rot2}^2 + \alpha_2 \, \delta_{trans}^2} \end{split}$$

Sample Odometry Motion Model

I. Algorithm sample_motion_model(u, x):

$$u = \langle \delta_{rot1}, \delta_{rot2}, \delta_{trans} \rangle, x = \langle x, y, \theta \rangle$$

1.
$$\hat{\delta}_{rot1} = \delta_{rot1} + \text{sample}(\alpha_1 \delta_{rot1}^2 + \alpha_2 \delta_{trans}^2)$$

2.
$$\hat{\delta}_{trans} = \delta_{trans} + \text{sample}(\alpha_3 \delta_{trans}^2 + \alpha_4 (\delta_{rot1}^2 + \delta_{trans}^2))$$

3.
$$\hat{\delta}_{rot2} = \delta_{rot2} + \text{sample}(\alpha_1 \delta_{rot2}^2 + \alpha_2 \delta_{trans}^2)$$

4.
$$x' = x + \hat{\delta}_{trans} \cos(\theta + \hat{\delta}_{rot1})$$

5.
$$y' = y + \hat{\delta}_{trans} \sin(\theta + \hat{\delta}_{rot1})$$

sample_normal_distribution

6.
$$\theta' = \theta + \hat{\delta}_{rot1} + \hat{\delta}_{rot2}$$

7. Return $\langle x', y', \theta' \rangle$

Sampling from Our Motion Model
