

CSE 2001:
Introduction to Theory of Computation
Fall 2013

Suprakash Datta

datta@cse.yorku.ca

Office: CSEB 3043

Phone: 416-736-2100 ext 77875

Course page: <http://www.eecs.yorku.ca/course/2001>

Administrivia

Lectures: Tue, Thu 4 - 5:30 pm (SLH E)

Office hours:

Tues, Thurs 5:30-6:30 pm (CSEB 3043),
or by appointment.

TA: Paria Mehrani, Bitia Banihashemi

<http://www.eecs.yorku.ca/course/2001>

Webpage: All announcements/handouts
will be published on the webpage --
check often for updates)

Textbook:

Michael Sipser.
Introduction to the
Theory of Computation,
Third Edition. Cengage
Learning, 2013.

Administrivia – contd.

Grading:

2 Midterms : 20% + 20% (in class)

Final: 40%

Assignments (4 or 5 sets): 20%

Grades will be on *ePost (linked from the web page)*

Notes:

1. All assignments are individual.
2. There MAY be an extra credit quiz -- will be announced beforehand.

Administrivia – contd.

Plagiarism: Will be dealt with very strictly. Read the detailed policies on the webpage.

Slides: Will usually be on the web the morning of the class. The slides are for MY convenience and for helping you recollect the material covered. They are not a substitute for, or a comprehensive summary of, the textbook.

Resources: We will follow the textbook closely.

There are more resources than you can possibly read – including books, lecture slides and notes.

Recommended strategy

- This is an applied Mathematics course -- practice instead of reading.
- Try to get as much as possible from the lectures.
- If you need help, get in touch with me early.
- If at all possible, try to come to the class with a fresh mind.
- Keep the big picture in mind. ALWAYS.

Course objectives - 1

Reasoning about computation

- Different computation models
 - Finite Automata
 - Pushdown Automata
 - Turing Machines
- What these models can and cannot do

Course objectives - 2

- What does it mean to say “there does not exist an algorithm for this problem”?
- Reason about the hardness of problems
- Eventually, build up a hierarchy of problems based on their hardness.

Course objectives - 3

- We are concerned with solvability, NOT efficiency.
- CSE 3101 (Design and Analysis of Algorithms) efficiency issues.

Reasoning about Computation

Computational problems may be

- Solvable, quickly
- Solvable in principle, but takes an infeasible amount of time (e.g. thousands of years on the fastest computers available)
- (provably) not solvable

Theory of Computation: parts

- Automata Theory (CSE 2001)
- Complexity Theory (CSE 3101, 4115)
- Computability Theory (CSE 2001, 4101)

Reasoning about Computation - 2

- Need formal reasoning to make credible conclusions
- Mathematics is the language developed for formal reasoning
- As far as possible, we want our reasoning to be intuitive

Ch. 0: Set notation and languages

Topics

- Sets and sequences
- Tuples
- Functions and relations
- Graphs
- Boolean logic: \vee \wedge \neg \Leftrightarrow \Rightarrow
- **Review of proof techniques**
 - Construction, Contradiction, Induction...

Some of these slides are adapted from Wim van Dam's slides (www.cs.berkeley.edu/~vandam/CS172/) and from Nathaly Verwaal (<http://cpsc.ucalgary.ca/~verwaal/313/F2005>)

Topics you should know:

- Elementary set theory
- Elementary logic
- Functions
- Graphs

Set Theory review

- Definition
- Notation: $A = \{ x \mid x \in \mathbf{N}, x \bmod 3 = 1 \}$
 $\mathbf{N} = \{1, 2, 3, \dots\}$
- Union: $A \cup B$
- Intersection: $A \cap B$
- Complement: \overline{A}
- Cardinality: $|A|$
- Cartesian Product:
$$A \times B = \{ (x, y) \mid x \in A \text{ and } y \in B \}$$

Some Examples

$$L_{<6} = \{ x \mid x \in \mathbf{N}, x < 6 \}$$

$$L_{\text{prime}} = \{ x \mid x \in \mathbf{N}, x \text{ is prime} \}$$

$$L_{<6} \cap L_{\text{prime}} = \{2, 3, 5\}$$

$$\Sigma = \{0, 1\}$$

$$\Sigma \times \Sigma = \{(0, 0), (0, 1), (1, 0), (1, 1)\}$$

$$\text{Formal: } A \cap B = \{ x \mid x \in A \text{ and } x \in B \}$$

Power set

“Set of all subsets”

Formal: $\mathcal{P}(A) = \{ S \mid S \subseteq A \}$

Example: $A = \{x, y\}$

$\mathcal{P}(A) = \{ \{ \} , \{x\} , \{y\} , \{x, y\} \}$

Note the different sizes: for finite sets

$$|\mathcal{P}(A)| = 2^{|A|}$$

$$|A \times A| = |A|^2$$

Graphs: review

- Nodes, edges, weights
- Undirected, directed
- Cycles, trees
- Connected

Logic: review

Boolean logic: \vee \wedge \neg

Quantifiers: \forall , \exists

statement: Suppose $x \in \mathbf{N}$, $y \in \mathbf{N}$.

Then $\boxed{\forall x \exists y y > x}$

for any integer, there exists a larger integer

\Rightarrow : $a \Rightarrow b$ “is the same as” (is logically equivalent to) $\neg a \vee b$

\Leftrightarrow : $a \Leftrightarrow b$ is logically equivalent to $(a \Rightarrow b) \wedge (b \Rightarrow a)$

Logic: review - 2

Contrapositive and converse:

the converse of $a \Rightarrow b$ is $b \Rightarrow a$

the contrapositive of $a \Rightarrow b$ is $\neg b \Rightarrow \neg a$

Any statement is logically equivalent to its contrapositive, but not to its converse.

Logic: review - 3

Negation of statements

$$\neg(\forall x \exists y y > x) \text{ “=” } \exists x \forall y y \leq x$$

(LHS: negation of “for any integer, there exists a larger integer”, RHS: there exists a largest integer)

TRY: $\neg(a \Rightarrow b) = ?$

Logic: review - 4

Understand quantifiers

$\forall x \exists y P(y, x)$ is not the same as

$\exists y \forall x P(y, x)$

Consider $P(y, x): x \leq y$.

$\forall x \exists y x \leq y$ is TRUE over **N** (set $y = x + 1$)

$\exists y \forall x x \leq y$ is FALSE over **N** (there is no largest number in **N**)

Functions: review

- $f: A \rightarrow C$
- $f: A \times B \rightarrow C$

Examples:

- $f: \mathbf{N} \rightarrow \mathbf{N}, f(x) = 2x$
- $f: \mathbf{N} \times \mathbf{N} \rightarrow \mathbf{N}, f(x,y) = x + y$
- $f: A \times B \rightarrow A, A = \{a,b\}, B = \{0,1\}$

	0	1
a	a	b
b	b	a

Functions: an alternate view

Functions as lists of pairs or k-tuples

- E.g. $f(x) = 2x$
- $\{(1,2), (2,4), (3,6), \dots\}$
- For the function below:

$$\{(a,0,a), (a,1,b), (b,0,b), (b,1,a)\}$$

	0	1
a	a	b
b	b	a

Next: Terminology

- Alphabets
- Strings
- Languages
- Problems, decision problems

Alphabets

- An alphabet is a finite non-empty set.
- An alphabet is generally denoted by the symbols Σ , Γ .
- Elements of Σ , called *symbols*, are often denoted by lowercase letters, e.g., a, b, x, y, \dots

Strings (or words)

- Defined over an alphabet Σ
- Is a finite sequence of symbols from Σ
- Length of string w ($|w|$) – length of sequence
- ε – the empty string is the unique string with zero length.
- Concatenation of w_1 and w_2 – copy of w_1 followed by copy of w_2
- $x^k = x x x x x \dots x$ (k times)
- w^R - reversed string; e.g. if $w = abcd$ then $w^R = dcba$.
- Lexicographic ordering : definition

Languages

- A language over Σ is a set of strings over Σ
- Σ^* is the set of all strings over Σ
- A language L over Σ is a subset of Σ^* ($L \subseteq \Sigma^*$)
- Typical examples:
 - $\Sigma = \{0, 1\}$, the possible words over Σ are the finite bit strings.
 - $L = \{ x \mid x \text{ is a bit string with two zeros} \}$
 - $L = \{ a^n b^n \mid n \in \mathbf{N} \}$
 - $L = \{ 1^n \mid n \text{ is prime} \}$

Concatenation of languages

Concatenation of two languages:

$$A \bullet B = \{ xy \mid x \in A \text{ and } y \in B \}$$

Caveat: Do not confuse the concatenation of languages with the Cartesian product of sets.

For example, let $A = \{0,00\}$ then

$$A \bullet A = \{ 00, 000, 0000 \} \text{ with } |A \bullet A| = 3,$$

$$A \times A = \{ (0,0), (0,00), (00,0), (00,00) \} \\ \text{with } |A \times A| = 4$$

Problems and Languages

- **Problem:** defined using input and output
 - compute the shortest path in a graph
 - sorting a list of numbers
 - finding the mean of a set of numbers.
- **Decision Problem:** output is YES/NO (or 1/0)
- **Language:** set of all inputs where output is yes

Historical perspective

- Many models of computation from different fields
 - Mathematical logic
 - Linguistics
 - Theory of Computation

Formal language
theory

Input/output vs decision problems

Input/output problem: “find the mean of n integers”

Decision Problem: output is either yes or no

“Is the mean of the n numbers equal to k ?”

You can solve the decision problem if and only if you can solve the input/output problem.

Example – Code Reachability

- **Code Reachability Problem:**
 - Input: Java computer code
 - Output: Lines of unreachable code.
- **Code Reachability Decision Problem:**
 - Input: Java computer code and line number
 - Output: Yes, if the line is reachable for some input, no otherwise.
- **Code Reachability Language:**
 - Set of strings that denote Java code and reachable line.

Example – String Length

- Decision Problem:
 - Input: String w
 - Output: Yes, if $|w|$ is even
- Language:
 - Set of all strings of even length.

Relationship to functions

- Use the set of k-tuples view of functions from before.
- A function is a set of k-tuples (words) and therefore a language.
- Shortest paths in graphs – the set of shortest paths is a set of paths (words) and therefore a language.

Recognizing languages

- Automata/Machines **accept** languages.
- Also called “recognizing languages”.
- The power of a computing model is related to, and described by, the languages it accepts/recognizes.
- Tool for studying different models

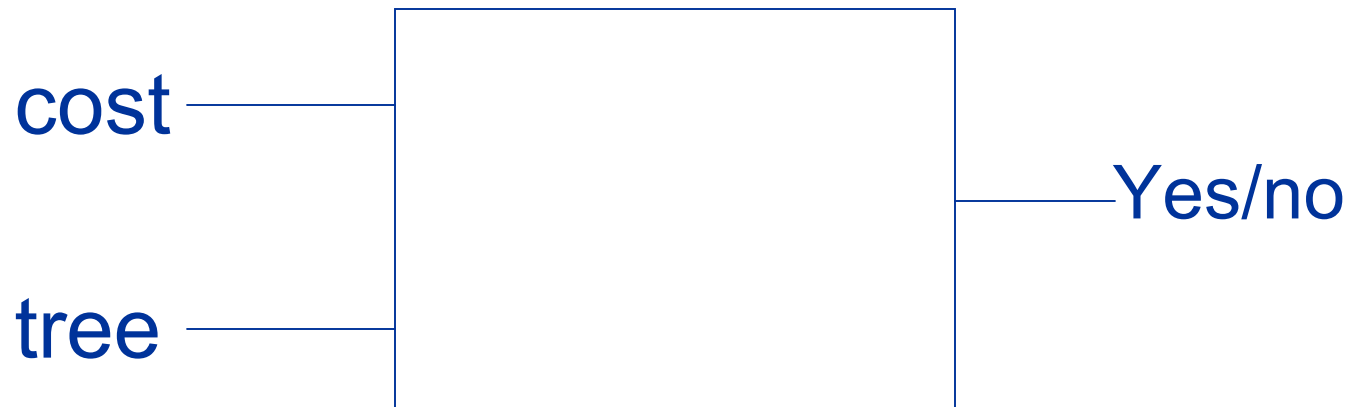

Recognizing Languages - 2

- Let L be a language $\subseteq S$
- a machine M recognizes L if

Recognizing languages - 3

- Minimal spanning tree problem solver

Recognizing languages - 4

- Tools from language theory
- Expressibility of languages
- Fascinating relationship between the complexity of problems and power of languages

Proofs

- What is a proof?
- Does a proof need mathematical symbols?
- What makes a proof incorrect?
- How does one come up with a proof?

Proof techniques (Sipser 0.4)

- Proof by cases
- Proof by contrapositive
- Proof by contradiction
- Proof by construction
- Proof by induction
- Others

Proof by cases

If n is an integer, then $n(n+1)/2$ is an integer

- Case 1: n is even.

or $n = 2a$, for some integer a

So $n(n+1)/2 = 2a(n+1)/2 = a(n+1)$,
which is an integer.

- Case 2: n is odd.

$n+1$ is even, or $n+1 = 2a$, for an integer a

So $n(n+1)/2 = n \cdot 2a/2 = n \cdot a$,
which is an integer.

Proof by contrapositive - 1

If x^2 is even, then x is even

- Proof 1 (DIRECT):

$$x^2 = x * x = 2a$$

So 2 divides x .

- Proof 2: prove the contrapositive

if x is odd, then x^2 is odd.

$$x = 2b + 1. \text{ So } x^2 = 4b^2 + 4b + 1 \text{ (odd)}$$

Proof by contrapositive - 2

If $\sqrt{pq} \neq (p+q)/2$, then $p \neq q$

Proof 1: By squaring and transposing

$$(p+q)^2 \neq 4pq, \text{ or}$$

$$p^2+q^2 +2pq \neq 4pq, \text{ or}$$

$$p^2+q^2 -2pq \neq 0, \text{ or}$$

$$(p-q)^2 \neq 0, \text{ or}$$

$$p-q \neq 0, \text{ or } p \neq q.$$

Proof 2: prove the contrapositive!

If $p = q$, then $\sqrt{pq} = (p+q)/2$

Easy: $\sqrt{pq} = \sqrt{pp} = \sqrt{p^2} = p = (p+p)/2 = (p+q)/2$.

Proof by contradiction

$\sqrt{2}$ is irrational

- Suppose $\sqrt{2}$ is rational. Then $\sqrt{2} = p/q$, such that p, q have no common factors.

Squaring and transposing,

$$p^2 = 2q^2 \text{ (even number)}$$

So, p is even (previous slide)

Or $p = 2x$ for some integer x

$$\text{So } 4x^2 = 2q^2 \text{ or } q^2 = 2x^2$$

So, q is even (previous slide)

So, p, q are both even – they have a common factor of 2. CONTRADICTION.

So $\sqrt{2}$ is NOT rational.

Q.E.D.

Proof by contradiction - 2

The Pigeonhole Principle

- If $n+1$ or more objects are placed into n boxes, then there is at least one box containing two or more of the objects
 - In a set of any 27 English words, at least two words must start with the same letter
- If n objects are placed into k boxes, then at least one box contains $\lceil n/k \rceil$ objects

Proof by construction

There exists irrational b, c , such that b^c is rational

Consider $\sqrt{2}^{\sqrt{2}}$. Two cases are possible:

- Case 1: $\sqrt{2}^{\sqrt{2}}$ is rational – DONE ($b = c = \sqrt{2}$).
- Case 2: $\sqrt{2}^{\sqrt{2}}$ is **irrational** – Let $b = \sqrt{2}^{\sqrt{2}}$, $c = \sqrt{2}$.

$$\text{Then } b^c = (\sqrt{2}^{\sqrt{2}})^{\sqrt{2}} = (\sqrt{2})^{\sqrt{2} \cdot \sqrt{2}} = (\sqrt{2})^2 = 2$$

Q: Do we know if $\sqrt{2}^{\sqrt{2}}$ is rational ?

Exercise: Debug this “proof”

For each positive real number a , there exists a real number x such that $x^2 > a$

Proof: We know that $2a > a$

So $(2a)^2 = 4a^2 > a$

So use $x = 2a$.

Proof by induction

Format:

- Inductive hypothesis,
 - Base case,
 - Inductive step.
-
- Powerful proof technique
 - When does it work?
 - Why is it useful?

Proof by induction

Prove: For any $n \in \mathbf{N}$, $n^3 - n$ is divisible by 3.

IH: $P(n)$: For any $n \in \mathbf{N}$, $f(n) = n^3 - n$ is divisible by 3.

Base case: $P(1)$ is true, because $f(1) = 0$.

Inductive step:

Assume $P(n)$ is true. Show $P(n+1)$ is true.

Observe that $f(n+1) - f(n) = 3(n^2 + n)$

So $f(n+1) - f(n)$ is divisible by 3.

Since $P(n)$ is true, $f(n)$ is divisible by 3.

So $f(n+1)$ is divisible by 3.

Therefore, $P(n+1)$ is true.

Exercise: give a direct proof.

Exercises

- Easy problem: Prove that 21 divides $4^{n+1} - 5^{2n-1}$ whenever n is a positive integer.
- (Q 19, pg 330, Rosen) Let $P(n)$ be the statement that
$$1 + 1/4 + 1/9 + \dots + 1/n^2 < 2 - 1/n$$
- (Q 61, pg 332, Rosen) Show that n lines separate the plane into $(n^2 + n + 2)/2$ regions if no two of these lines are parallel and no three of these lines intersect at a point.

Recursively defined sets

Close relationship to induction

Example: set of all palindromes P

- $\varepsilon \in P; \forall a \in \Sigma, a \in P;$
- $\forall a \in \Sigma, \forall x \in P, axa \in P$
- No other strings are in P

More definitions

Definition of Σ^* :

- $\varepsilon \in \Sigma^*$;
- $\forall a \in \Sigma, \forall x \in \Sigma^*, xa \in \Sigma^*$;
- No other strings are in Σ^* .

Exercise

Suppose $\Sigma = \{a,b\}$. Define L as

- $a \in L$;
- $\forall x \in L, ax \in L$
- $\forall x, y \in L, bxy, xby$ and xyb are in L
- No other strings are in L
- Prove that this is the language of strings with more a's than b's.

Next: Finite automata

Ch. 1: Deterministic finite automata (DFA)

Look ahead:

We will study languages recognized by finite automata.
