

Java By Abstraction: Chapter 7

Software Development

Some examples and/or figures were borrowed (with permission)
from slides prepared by Prof. H. Roumani

Development Process

- ▶ Design
- ▶ Implementation
- ▶ Testing
- ▶ Deployment

Design

- ▶ How the system will work
- ▶ Algorithm to generate the desired output
- ▶ Outline delegation of tasks
- ▶ Identify needed classes, methods, and attributes
- ▶ Determine how data will be exchanged amongst the various components

Implementation

- ▶ Involves coding...
 - Existing classes can be used/extended to meet requirements
 - New class created from scratch
- ▶ ...and unit testing
 - Functionality of classes are tested individually to ensure adherence to specifications
 - (more details shortly)

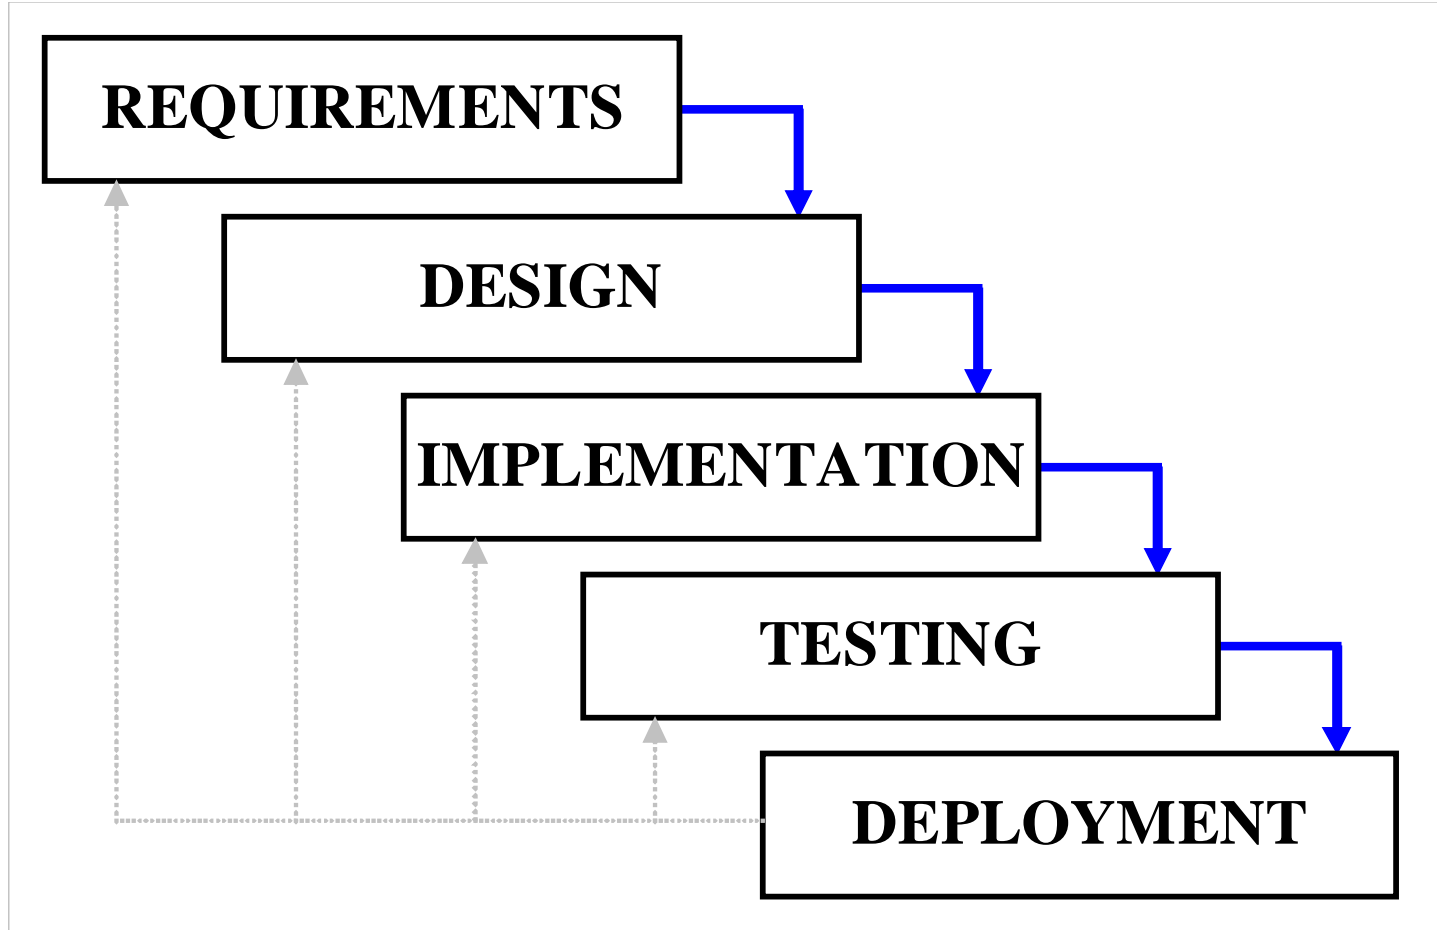

(Integration) Testing

- ▶ Evaluate entire system as a whole
- ▶ Ensure components work well together
- ▶ Ensure components exchange data correctly
 - Data formatting is especially important
 - Involves meeting specifications, not just “for looks”

Deployment

- ▶ **Deployment**
 - Package, deliver, and install system for customer
- ▶ **Operation**
 - Ensure functionality at the customer's location
 - Train customer's employees to operate system
- ▶ **Maintenance**
 - Develop and deploy updates, patches, and fixes
 - Perform upgrades

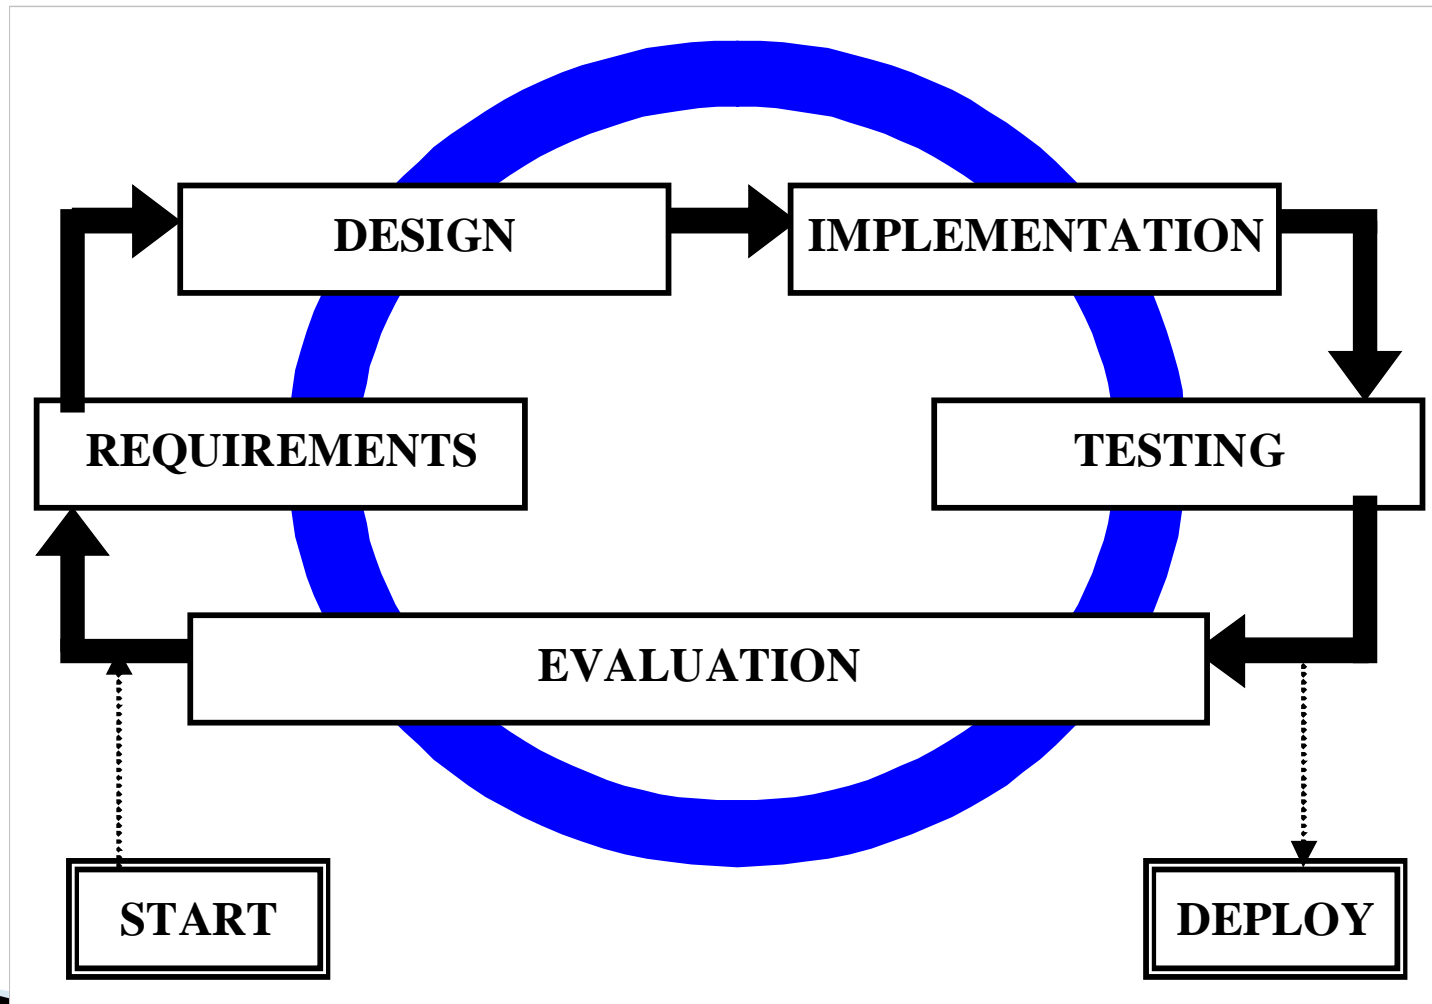

Waterfall Model

Shortcomings of the Waterfall Model

- ▶ Detection and handling of risks is delayed until the testing phase
- ▶ Risks include:
 - Interoperability problems amongst components
 - Requirement changes
 - Incorrect assumptions

Iterative Methodology

Iterative Methodology Models

- ▶ Agile software development
- ▶ Extreme Programming (XP)
- ▶ (IBM) Rational Unified Process (RUP)
- ▶ SCRUM development

Design Techniques

Some examples and/or figures were borrowed (with permission)
from slides prepared by Prof. H. Roumani

Unified Modelling Language (UML)

- ▶ Visual language used to describe characteristics and interactions of software components
- ▶ Formal language with rules but also flexible
- ▶ UML tools convert UML diagrams ↔ code

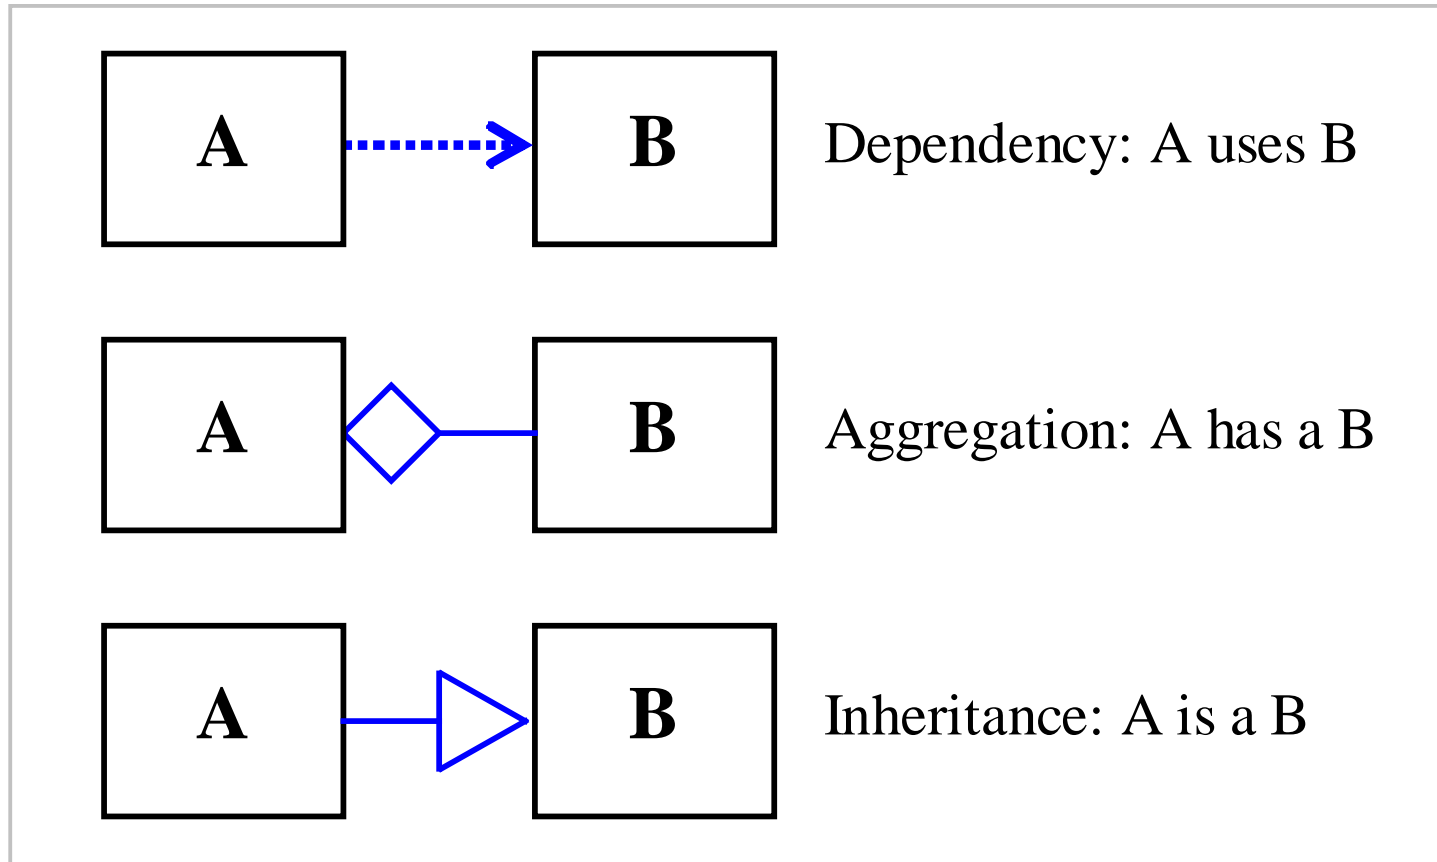

UML Diagrams

type::lib::Fraction

+ isQuoted: boolean
+ separator: char

+ getNumerator(): long
+ setFraction(Fraction)
+ toString(): String

UML Relationships

Software Testing

Some examples and/or figures were borrowed (with permission)
from slides prepared by Prof. H. Roumani

Formal Proofs

- ▶ Written proofs using:
 - Discrete mathematics
 - Axioms
 - Theorems
- ▶ Covered in MATH1019 and MATH1090

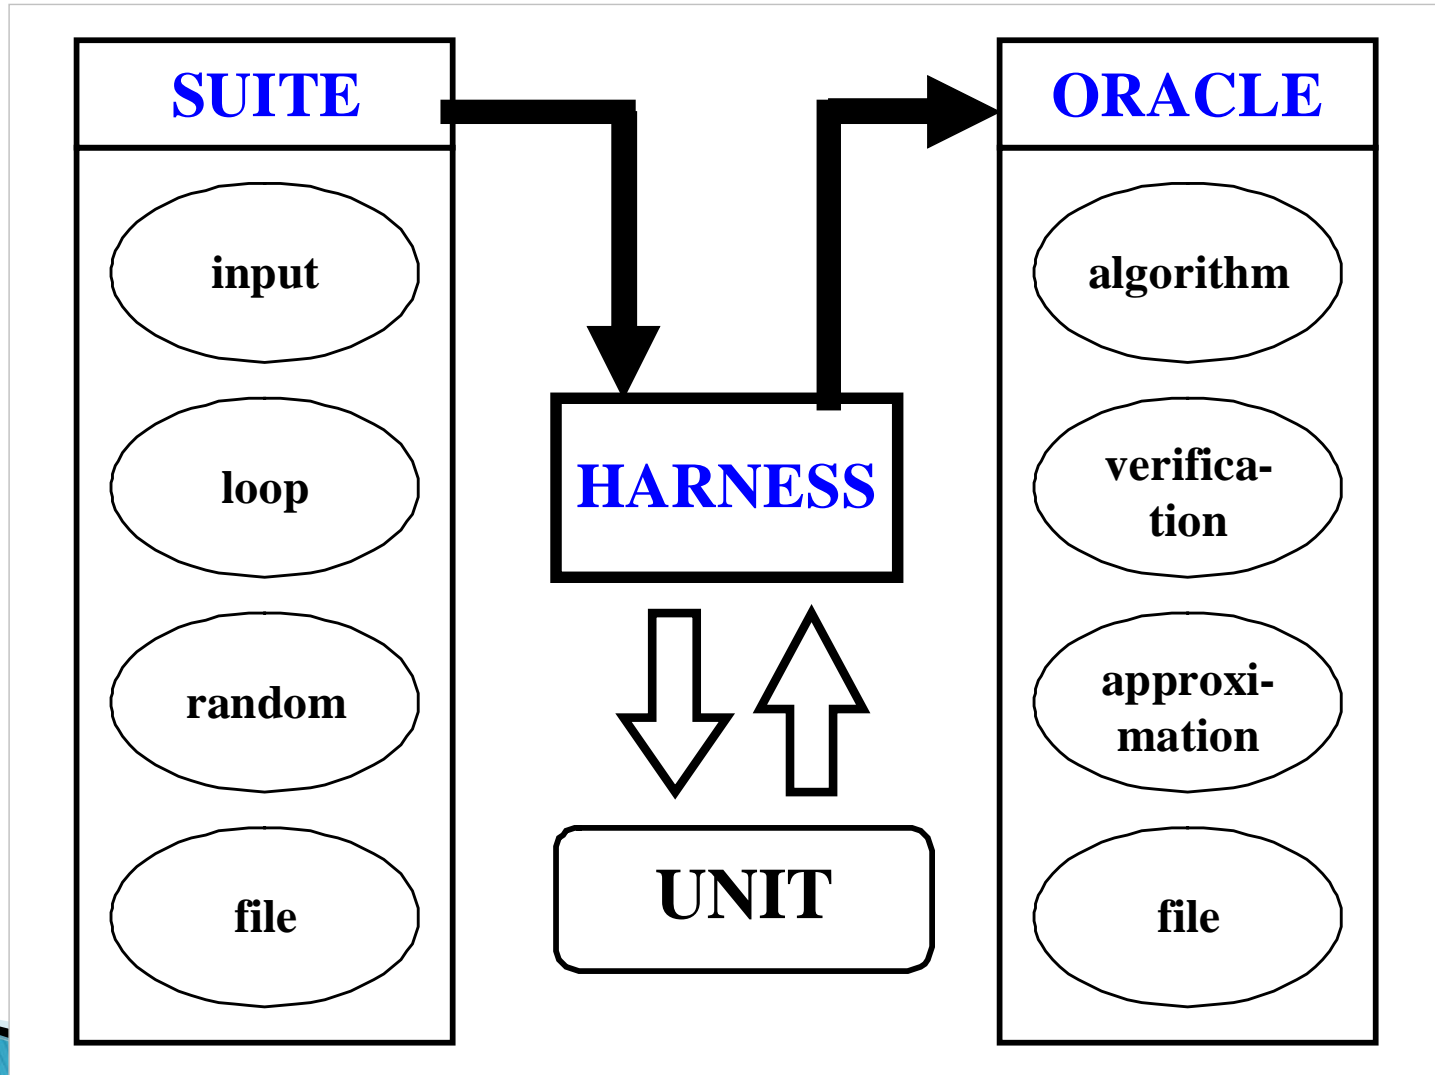

Test Vector

- ▶ Collection of test cases
- ▶ Test cases should include:
 - Values within range
 - Values outside range
 - Boundary cases
- ▶ Each case should hold meaning and test a specific aspect of the component
- ▶ Cover as many execution paths as possible
- ▶ Employ regression testing

Test Harness

- ▶ Program to automate the testing of a component
- ▶ Takes unit test input
- ▶ Compares component output to oracle's output
- ▶ Oracle:
 - Separate mechanism, component, or algorithm
 - Provides the “correct answer”
- ▶ Can you give an example of a test harness?

Test Harness

Debugging

- ▶ Determine and fix source of error
- ▶ Techniques:
 - Examine code (tedious, error-prone)
 - Print statements to output intermediate steps/values
 - Examine error messages for source details
 - Use debuggers
