

# Programming for Mobile Computing

## EECS 1022

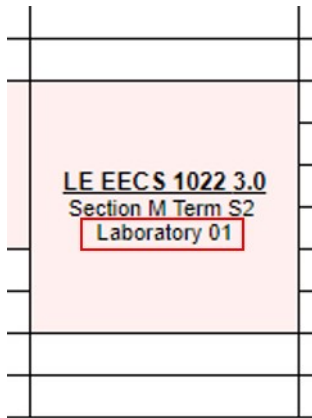

`moodle.yorku.ca`

Final exam (programming part) will take place on Thursday July 27 during lab time. In particular,

- Lab 01: 20:00-21:15
- Lab 02: 18:30-19:45
- Lab 03: 15:30-16:45

# Final exam (programming part)

To find out in which lab you are officially registered, please check your online lecture schedule.

The diagram shows a table with a grid of cells. The second row from the top and the second column from the left are highlighted in light pink. Inside this highlighted cell, the following text is centered:

**LE EECS 1022 3.0**  
**Section M Term S2**  
**Laboratory 01**

The text "Laboratory 01" is enclosed in a red rectangular border.

# Final exam (programming part)

- Question 1: 10 marks, partial marks awarded
- Question 2: 5 marks, partial marks awarded
- Question 3: 5 marks, partial marks awarded
- Question 4: 2.5 marks, no partial marks awarded
- Question 5: 2.5 marks, no partial marks awarded
- Question 6: 2.5 marks, no partial marks awarded
- Question 7: 2.5 marks, no partial marks awarded

- Tuesday August 1, 17:30-19:30
- Thursday August 3, 17:30-19:30

## Question

Consider

```
List<String> words = ...;  
String search = ...;  
boolean found = false;  
“for each word in the list words”  
{  
    found = word.equals(search) || found;  
}
```

How do we express “for each word in the list words”?

## Question

Consider

```
List<String> words = ...;
String search = ...;
boolean found = false;
“for each word in the list words”
{
    found = word.equals(seach) || found;
}
```

How do we express “for each word in the list words”?

## Answer

Let us check the API of the List interface: <https://docs.oracle.com/javase/8/docs/api/java/util/List.html>

“for each word in the list words” can be expressed as

```
Iterator<String> iterator = words.iterator();  
while ( iterator.hasNext()  
{  
    String word = iterator.next();  
    ...  
}
```

```
Iterator<String> iterator = words.iterator();  
while (iterator.hasNext())  
{  
    String word = iterator.next();  
    ...  
}
```

can be abbreviated to

```
for (String word : words)  
{  
    ...  
}
```

## Question

Consider

```
List<String> words = ...;  
String search = ...;  
boolean found = false;  
for (String word : words)  
{  
    found = word.equals(search) || found;  
}
```

Given that the list contains  $n$  elements, how many times is the method `equals` invoked?

## Question

Consider

```
List<String> words = ...;
String search = ...;
boolean found = false;
for (String word : words)
{
    found = word.equals(search) || found;
}
```

Given that the list contains  $n$  elements, how many times is the method `equals` invoked?

## Answer

$n$  times.

```
int index = Collections.binarySearch(list, element);
```

- The list must be sorted.
- If the element is contained in the list then the method returns the index at which the element can be found.
- If the element is not in the list then the method returns  $-1$ .

```
final int ELEMENT = 11;  
int index = Collections.binarySearch(list, ELEMENT);
```

|   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |
|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|
| 1 | 3 | 6 | 10 | 11 | 14 | 18 | 18 | 21 | 24 | 25 | 28 | 30 | 33 | 34 |
|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|

```
final int ELEMENT = 11;  
int index = Collections.binarySearch(list, ELEMENT);
```

```

|   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |
|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|
| 1 | 3 | 6 | 10 | 11 | 14 | 18 | 18 | 21 | 24 | 25 | 28 | 30 | 33 | 34 |
|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|

↓

index gets assigned the value  $-1$ .

## The temperature app

- randomly selects a city in Ontario,
- reads a corresponding URL, and
- extracts the current temperature.

For each city, we need a corresponding URL. These can be stored in a file.

```
on-122_metric_e.html  Alexandria
on-1_metric_e.html   Algonquin Park (Brent)
on-29_metric_e.html  Algonquin Park (Lake of Two Rivers)
on-114_metric_e.html Alliston
on-30_metric_e.html  Apsley
on-111_metric_e.html Armstrong
on-148_metric_e.html Atikokan
on-164_metric_e.html Attawapiskat
...
```

## Question

What is the most appropriate collection to store the cities and their URLs? A list, a set or a map?

## Question

What is the most appropriate collection to store the cities and their URLs? A list, a set or a map?

## Answer

A map.

## Question

What is the most appropriate collection to store the cities and their URLs? A list, a set or a map?

## Answer

A map.

## Question

What are the types of the keys and values of the map?

## Question

What is the most appropriate collection to store the cities and their URLs? A list, a set or a map?

## Answer

A map.

## Question

What are the types of the keys and values of the map?

## Answer

String and URL.

# Object Serialization

Rather than reading a string representation of an object from a file and creating the object, we can also read the object from a file directly.

```
ObjectInputStream objectInput =
    new ObjectInputStream(
        new FileInputStream("cities.dat"));
Object object = objectInput.readObject();
if (object instanceof Map)
{
    Map<String, URL> map = (Map) object;
}
objectInput.close();
```

Rather than writing a string representation of an object to a file, we can also save the object to a file directly.

```
ObjectOutputStream objectOutput =  
    new ObjectOutputStream(  
        new FileOutputStream("cities.dat"));  
objectOutput.writeObject(map);  
objectOutput.close();
```

## Question

Which objects can be serialized?

## Question

Which objects can be serialized?

## Answer

Those objects that are an instance of a class that implements the interface `Serializable` .
