

# Numbers and Array

## EECS 2031

**Song Wang**

wangsong@eecs.yorku.ca  
eecs.yorku.ca/~wangsong/

# Acknowledgement

- Some of the covered materials are based on previous EECS2031 offerings:
  - Uyen Trang (UT) Nguyen, Pooja Vashisth, Hui Wang, Manos Papagelis

# Binary number (base 2)

- A binary number is a number that includes only ones and zeroes.
- The number could be of any length
- The following are all examples of binary numbers

0	10101
1	0101010
10	1011110101
01	0110101110
111000	000111

- Another name for binary is base-2 (pronounced "base two")

# Decimal (base 10)

- Uses positional representation
- Each digit corresponds to a power of 10 based on its position in the number
- The powers of 10 increment from 0, 1, 2, etc. as you move right to left

$$1,479 = 1 * 10^3 + 4 * 10^2 + 7 * 10^1 + 9 * 10^0$$

# Equivalence of Binary and Decimal

- Every Binary number has a corresponding Decimal value (and vice versa)
- Examples:

Binary Number

Decimal Equivalent

1     1

10    2

11    3

...    ...

1010111    87

# Hexadecimal (base 16)

- A “hexadecimal” number is a number where each digit may be one of sixteen possible values.
- The possible values for a hexadecimal digit are:  
0 1 2 3 4 5 6 7 8 9 A B C D E F
- A digit of
  - “A” stands for the number 10
  - “B” stands for the number 11
  - “C” stands for the number 12
  - “D” stands for the number 13
  - “E” stands for the number 14
  - “F” stands for the number 15

# Hexadecimal numbers

- The following are all valid hexadecimal numbers
  - A
  - 9 (yes, a hexadecimal number does not HAVE TO contain letters)
  - 1001 (yes, a hexadecimal number does not HAVE TO contain letters)
  - 9C5
  - BFE
- To understand what a specific hexadecimal number means, you can convert it into an equivalent decimal number.

# Converting a Hexadecimal number to Decimal

- The value of hexadecimal **A12F** is decimal 41,263. See below:

4096 (i.e  $16^3$ )    256 (i.e  $16^2$ )    16 (i.e  $16^1$ )    1 (i.e  $16^0$ )

---

**A**        **1**        **2**        **F**

$15 \times 1 = 15$

$2 \times 16 = 32$   
 $1 \times 256 = 256$

$10 \times 4096 = 40,960$

----

**Answer:            41,263**

# Another example

**0xABC = ?**

Binary	Decimal	Hexadecimal
0000	0	0
0001	1	1
0010	2	2
0011	3	3
0100	4	4
0101	5	5
0110	6	6
0111	7	7
1000	8	8
1001	9	9
1010	10	A
1011	11	B
1100	12	C
1101	13	D
1110	14	E
1111	15	F
10000	16	10

# Octal Numbers (base 8)

- Like the hexadecimal system, the octal system provides a convenient way to express binary numbers and codes.
- However, it is used less frequently than hexadecimal in conjunction with computers and microprocessors to express binary quantities for input and output purposes.
- The octal system is composed of eight digits, which are:  

0, 1, 2, 3, 4, 5, 6, 7
- Counting in octal is similar to counting in decimal, except that the digits 8 and 9 are not used.

# Integer Constants

- Integer constants can be expressed in three different ways

## 1. Decimal [base 10]

- `int x = 31`

same in Java

## 2. Octal [base 8]

- Start with zero 0
- `int x = 037` (31 in decimal)

same in Java

## 3. Hexadecimal [base 16]

- Start with `0x` or `0X`
- `int x = 0x1F` (31 in decimal)

same in Java

```
3
4  /* salute the world */
5
6  main ()
7  {
8      int x = 31;
9      int x2 = 037;
10     int x3 = 0x1F;
11
12     printf( "%d\n", x );
13     printf( "%d\n", x2 );
14     printf( "%d\n", x3 );
15
16 }
17
18
```

same in Java

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

```
ea06 313 % gcc binaryLiteral0.c
ea06 314 % a.out
31
31
31
ea06 315 % █
```

# Binary literal is not C standard, although it might work

```
4  /* salute the world */
5
6  main ()
7  {
8      int x = 30;
9      int x2 = 037;
10     int x3 = 0x1F;
11     int x4 = 0b01111011;
12     printf( "Hello, world\n" );
13 }
14
15
```

okay in Java

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

```
ea57 318 % gcc -pedantic-errors binaryLiteral.c
binaryLiteral.c: In function 'main':
binaryLiteral.c:11:12: error: binary constants are a GCC extension
    int x4 = 0b01111011;
                ^
ea57 319 %
```

# Integer Constants (cont.)

- We can specify type qualifier at the end:

- 'u' or 'U'  $\Rightarrow$  **unsigned (int)**
- 'l' or 'L'  $\Rightarrow$  **long (int)**
- nothing  $\Rightarrow$  **int**

same in Java

- E.g.

5	as an	<b>“(signed) (decimal) int”</b>	<b>5</b>
5U	as an	<b>“unsigned (decimal) int”</b>	<b>5</b>
5L	as a	<b>“(signed) long (int)”</b>	<b>5</b>
5UL or 5ul	as an	<b>“unsigned long (int)”</b>	<b>5</b>
037	as an	<b>“(signed) int (oct)”</b>	<b>decimal: 31</b>
0x32dUL	as an	<b>“unsigned long (int) in hex 32d”</b>	
059	as an	<b>?</b>	
0x39G2	as an	<b>?</b>	

# Floating Point Constants

- All floating point constants contain a decimal point('.') and/or an exponent ('e' or "E")

- E.g. `1.532` `3e5` `4.112e-10`

- `5.3e12` ==  $5.3 \times 10^{12}$

- `printf("%E %e", 0.00137, 123.025);`

`1.370000E-03 1.230250e+02`

---

- Floating point constants are of type 'double'

- Nothing – means “**double**” e.g., `double x = 1.532`

same in Java

- 'f' or 'F' - means “**float**” e.g. `float x = 1.532f`

`float x = 1.532` OK

same in Java

- 'l' or 'L' - means “**long double**” e.g. `long double x=1.5L`

same in Java

# Arrays

```
int a [10];
```

```
double x [20][30];
```

- Sequence of values **with the same type**
- Accessed using an index:
  - Example: a[5]
  - Indices between 0 and size-1
- Initialization
  - local variable: random data
  - global/**static** variables: **“0”**

```
#include<stdio.h>

int foo();

int main(){
    int a [2];
    static int b[2];
    int c [2] ={0};

    printf("a[1] is: %d\n", a[1]);
    printf("b[1] is: %d\n", b[1]);
    printf("c[1] is: %d\n", c[1]);
    foo();
}

int foo(){
    int a[2];
    static int b[2];
    int c[2] = {0};

    printf("Inside foo \n");
    printf("a[1] is: %d\n", a[1]);
    printf("b[1] is: %d\n", b[1]);
    printf("c[1] is: %d\n", c[1]);
}
```

```

#include<stdio.h>

int foo();

int main(){
    int a [2];
    static int b[2];
    int c [2] ={0};

    printf("a[1] is: %d\n", a[1]);
    printf("b[1] is: %d\n", b[1]);
    printf("c[1] is: %d\n", c[1]);
    foo();
}

int foo(){
    int a[2];
    static int b[2];
    int c[2] = {0};

    printf("Inside foo \n");
    printf("a[1] is: %d\n", a[1]);
    printf("b[1] is: %d\n", b[1]);
    printf("c[1] is: %d\n", c[1]);
}

```

```

indigo 308 % ./arrays
a[1] is: 0
b[1] is: 0
c[1] is: 0
Inside foo
a[1] is: 32562
b[1] is: 0
c[1] is: 0
indigo 309 % ./arrays
a[1] is: 0
b[1] is: 0
c[1] is: 0
Inside foo
a[1] is: 32536
b[1] is: 0
c[1] is: 0

```

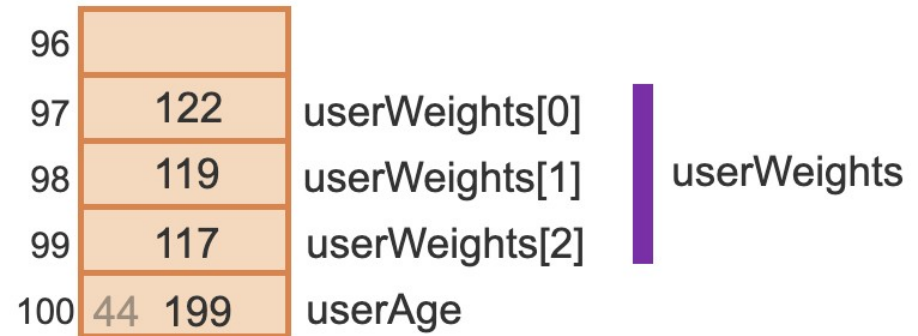

# Iterating through arrays

```
int userWeights[3];
int userAge;

userAge = 44;

userWeights[0] = 122;
userWeights[1] = 119;
userWeights[2] = 117;
userWeights[3] = 199; // (Problematic)

// Print userAge
```

199

# Two-dimensional arrays

```
#include <stdio.h>

/* Direct driving distances between cities, in miles */
/* 0: Boston 1: Chicago 2: Los Angeles */

int main(void) {
    int cityA;           // Starting city
    int cityB;           // Destination city
    int drivingDistances[3][3]; // Driving distances

    // Initialize distances array
    drivingDistances[0][0] = 0;
    drivingDistances[0][1] = 960; // Boston-Chicago
    drivingDistances[0][2] = 2960; // Boston-Los Angeles
    drivingDistances[1][0] = 960; // Chicago-Boston
    drivingDistances[1][1] = 0;
    drivingDistances[1][2] = 2011; // Chicago-Los Angeles
    drivingDistances[2][0] = 2960; // Los Angeles-Boston
    drivingDistances[2][1] = 2011; // Los Angeles-Chicago
    drivingDistances[2][2] = 0;
```

# Initializing a 2D array during the declaration

```
// Initializing a 2D array  
int numVals[2][3] = { {22, 44, 66}, {97, 98, 99} };  
  
// Use multiple lines to make rows more visible  
int numVals[2][3] = {  
    {22, 44, 66}, // Row 0  
    {97, 98, 99} // Row 1  
};
```

# Strings

- Single-quoted characters refer to numeric value in ASCII table

```
char x = 'A'; // same as x = 65
```

```
char y = '0'; // same as y = 48
```

- In C, strings are simply arrays of characters
  - Each element corresponds to a character
  - Character stored as numeric representation from ASCII table
  - Last character followed by a value of zero: termination byte

```
char s1[] = "EECS 2031";
```

```
char s2[] = { 'E', 'E', 'C', 'S', ' ', '2', '0', '3', '1', 0 };
```

```
char s3[] = { 69, 69, 67, 83, 32, 50, 48, 51, 49, 0 };
```

# Char arrays / C strings

```
#include <stdio.h>

int main(void) {
    char cityName[20] = "Forest Lake"; // Compiler appends null char

    // In each printf(), printing stops when reaching null char
    printf("%s\n", "City:");           // Compiler appends null char to "City:"
    printf("%s\n", cityName);

    return 0;
}
```

```

int main(void) {
    char userStr[20] = "1234567890123456789"; // Input string
    int i;

    // Prompt user for string input
    printf("Enter string (<20 chars): ");
    scanf("%s", userStr);

    // Print string
    printf("\n%s\n", userStr);

    // Look for '@'
    for (i = 0; userStr[i] != '\0'; ++i) {
        if (userStr[i] == '@') {
            printf("Found '@'.\n");
        }
    }

    // The following is an ERROR.
    // May print chars it shouldn't.
    // Problem: doesn't stop at null char.
    printf("\n\n"); // Print opening "
    for (i = 0; i < 20; ++i) { // Print each char
        printf("%c", userStr[i]);
    }
    printf("\n\n"); // Print closing "

    // The following is an even WORSE ERROR.
    // Accesses beyond valid index range.
    // Program may crash.
    printf("\n\n"); // Print opening "
    for (i = 0; i < 30; ++i) {
        printf("%c", userStr[i]); // Print each char
    }
    printf("\n\n"); // Print closing "

```

Enter string (<20 chars): test@gmail.com

test@gmail.com

Found '@'.

"test@gmail.com6789"

"test@gmail.com6789\$\305\366;\226\333"

# An example involving reading char arrays

```
#include<stdio.h>
int length (char []);

main() {
    char my_strg[100];
    int a;

    printf("Enter a word and an int separated by blank>");
    scanf("%s %d", my_strg, &a);
    printf("%d %s %d", a, my_strg, length(my_strg));
}

int length(char arr[]){
    int i = 0;
    while (arr[i] != '\0')
        i++;
    return i;
}
```

No & needed!  
Another big topic.  
Investigate later

```
indigo 326 % a.out
Enter a word and an int by blank> hello 23
23 hello 5
```

# Read string using scanf

```
char my_strg[100];  
scanf ("%s", &my_strg);  
scanf ("%s", my_strg);  
  
printf ("%s", my_strg);
```

# String library functions

```
char orgName[100] = "United Nations";  
char userText[20] = "UNICEF";  
char targetText[10];
```

<b>strcpy()</b>	<pre>strcpy(destStr, sourceStr)</pre> <p>Copies sourceStr (up to and including null character) to destStr.</p>	<pre>strcpy(targetText, userText); // Copies "UNICEF" + null char                                 // to targetText strcpy(targetText, orgName); // Error: "United Nations"                                 // has &gt; 10 chars targetText = orgName;         // Error: Strings can't be                                 // copied this way</pre>
<b>strncpy()</b>	<pre>strncpy(destStr, sourceStr, numChars)</pre> <p>Copies up to numChars characters.</p>	<pre>strncpy(orgName, userText, 6); // orgName is "UNICEF Nations"</pre>
<b>strcat()</b>	<pre>strcat(destStr, sourceStr)</pre> <p>Copies sourceStr (up to and including null character) to <i>end</i> of destStr (starting at destStr's null character).</p>	<pre>strcat(orgName, userText); // orgName is "United NationsUNICEF"</pre>
<b>strncat()</b>	<pre>strncat(destStr, sourceStr, numChars)</pre> <p>Copies up to numChars characters to destStr's end, then appends null character.</p>	<pre>strcpy(targetText, "abc"); // targetText is "abc" strncat(targetText, "123456789", 3); // targetText is "abc123"</pre>

```
char orgName[100] = "United Nations";
char userText[20] = "UNICEF";

# Inputting strings with white spaces

- `fgets(str, num, stdin)`
- Reads one line of characters from user input, ending with a newline, and writes those characters into the C string `str`.
- If a newline character is read from the user input before `num` characters are read, the newline character itself is also written into `str`, after which the function appends a null character.
- `num` is the maximum number of characters to be written into `str`.
- If `num` is 10 and the input line exceeds 10 characters, only the first 9 characters will be written into `str`, followed by the null character; the remaining input characters will not be read and will remain in user input.

```

#include <stdio.h>
#include <string.h>

int main(void) {
    char nameArr[10];        // User specified name
    char greetingArr[17];   // Output greeting and name

    // Prompt user to enter a name
    printf("Enter name: ");
    fgets(nameArr, 10, stdin);

    // Eliminate end-of-line char
    if (nameArr[strlen(nameArr) - 1] == '\n') {
        nameArr[strlen(nameArr)-1] = '\0';
    }

    // Modify string, hello + user specified name
    strcpy(greetingArr, "Hello ");
    strcat(greetingArr, nameArr);
    strcat(greetingArr, ".");

    // Output greeting and name
    printf("%s\n", greetingArr);

    return 0;

# Array of strings

```
int main(void) {
    const int NUM_COUNTRY = 10;           // Number of countries supported
    const int MAX_COUNTRY_NAME_LENGTH = 50; // Max length for names
    char ctryNames[NUM_COUNTRY][MAX_COUNTRY_NAME_LENGTH]; // 2D array of country tv stats
    int arrPosition = 0;                 // User specified position

    // Populate array
    strcpy(ctryNames[0], "U.S.A.");
    strcpy(ctryNames[1], "Italy");
    strcpy(ctryNames[2], "Poland");
    strcpy(ctryNames[3], "U.K.");
    strcpy(ctryNames[4], "Canada");
    strcpy(ctryNames[5], "Spain");
    strcpy(ctryNames[6], "France");
    strcpy(ctryNames[7], "Germany");
    strcpy(ctryNames[8], "Brazil");
    strcpy(ctryNames[9], "Russia");

    // Prompt user to enter desired position
    printf("Enter desired position (1-10): ");
    scanf("%d", &arrPosition);

    // Print results
    printf("People in %s watch the %d", ctryNames[arrPosition-1], arrPosition);
    if( arrPosition == 1 ) {
        printf("st");
    }
}
```

# Math

- Defined in standard library, prototype in `<math.h>`
- Need to link by `-lm`
  
- `double sin(double x), cos(x), tan(x)`
- `double asin(x) acos(x) atan(x) ...`
- `double exp(x) ex`
- `double log(x) -- ln(x)`
- `double log10(x)`
- `double pow(x,y) xy`
- `double sqrt(x)  $\sqrt{x}$`
- `double ceil(x)` smallest `int` not less than `x`, as a `double`!
- `double floor(x)` largest `int` not greater than `x`, as a `double`!

`x, y` are of  
type `double`  
return `double`

# Char Classification

```
int islower(int ch)  ch >='a' && ch <='z'
int isupper(int ch) ch >='A' && ch <='Z'
int isalpha(int ch) islower(ch) || isupper(ch)
int isdigit(int ch) ch >='0' && ch <='9'
int isalnum(int ch) isalpha(ch) or isdigit(ch)
int isxdigit(int ch) '0'-'9', 'a'-'f', 'A'-'F',

int tolower(int ch) {
int toupper(int ch) {
    if (isupper(ch))
        return ch + ('a' - 'A');
    else return ch;
```

# assert.h

```
void assert(int expression)
```

```
int x = -1;
```

```
assert(x > 0)
```

```
print Assertion failed: expression, file file, line lnum
```

```
Then abort()
```

# assert.h

Using the assert() macro.

```
1: /* The assert() macro. */
2:
3: #include <stdio.h>
4: #include <assert.h>
5:
6: main()
7: {
8:     int x;
9:
10:    printf("\nEnter an integer value: ");
11:    scanf("%d", &x);
12:
13:    assert(x >= 0);
14:
15:    printf("You entered %d.\n", x);
16:    return(0);
17: }
Enter an integer value: 10
You entered 10.
Enter an integer value: -1
Assertion failed: x, file list19_3.c, line 13
Abnormal program termination
```
