

# Aggregation and Composition

EECS2030 B: Advanced Object Oriented Programming  
Fall 2018

CHEN-WEI WANG

## Call by Value (2.1)

For illustration, let's assume the following variant of the Point class:

```
class Point {
  int x;
  int y;
  Point(int x, int y) {
    this.x = x;
    this.y = y;
  }
  void moveVertically(int y) {
    this.y += y;
  }
  void moveHorizontally(int x) {
    this.x += x;
  }
}
```

## Call by Value (1)

- Consider the general form of a call to some *mutator method* `m1`, with *context object* `s` and *argument value* `arg`:

```
class Supplier {
  void m1(T par) {
    /* manipulate par */
  }
}
```

```
class Client {
  Supplier s = new Supplier();
  T arg = ...;
  s.m1(arg)
}
```

- To execute `s.m1(arg)`, an implicit `par := arg` is done.  
⇒ A **copy** of value stored in `arg` is passed for the method call.
- What can the type `T` be? [ Primitive or Reference ]
  - `T` is primitive type (e.g., int, char, boolean, etc.):  
**Call by Value**: Copy of `arg`'s **value** (e.g., 2, 'j') is passed.
  - `T` is reference type (e.g., String, Point, Person, etc.):  
**Call by Value**: Copy of `arg`'s **stored reference/address** (e.g., Point@5cb0d902) is passed.

## Call by Value (2.2.1)

```
public class Util {
  void reassignInt(int j) {
    j = j + 1; }
  void reassignRef(Point q) {
    Point np = new Point(6, 8);
    q = np; }
  void changeViaRef(Point q) {
    q.moveHorizontally(3);
    q.moveVertically(4); } }
}
```

```
1 @Test
2 public void testCallByVal() {
3   Util u = new Util();
4   int i = 10;
5   assertTrue(i == 10);
6   u.reassignInt(i);
7   assertTrue(i == 10);
8 }
```

- Before** the mutator call at L6, **primitive** variable `i` stores 10.
- When** executing the mutator call at L6, due to **call by value**, a copy of variable `i` is made.  
⇒ The assignment `i = i + 1` is only effective on this copy, not the original variable `i` itself.
- ∴ **After** the mutator call at L6, variable `i` still stores 10.

## Call by Value (2.2.2)

## Call by Value (2.3.2)

## Call by Value (2.3.1)

```

public class Util {
    void reassignInt(int j) {
        j = j + 1; }
    void reassignRef(Point q) {
        Point np = new Point(6, 8);
        q = np; }
    void changeViaRef(Point q) {
        q.moveHorizontally(3);
        q.moveVertically(4); } }
1  @Test
2  public void testCallByRef_1() {
3      Util u = new Util();
4      Point p = new Point(3, 4);
5      Point refOfPBefore = p;
6      u.reassignRef(p);
7      assertTrue(p==refOfPBefore);
8      assertTrue(p.x==3 && p.y==4);
9  }
    
```

- **Before** the mutator call at L6, **reference** variable p stores the **address** of some Point object (whose x is 3 and y is 4).
- **When** executing the mutator call at L6, due to **call by value**, a **copy of address** stored in p is made.
  - ⇒ The assignment p = np is only effective on this copy, not the original variable p itself.
- ∴ **After** the mutator call at L6, variable p still stores the original address (i.e., same as refOfPBefore).

## Call by Value (2.4.1)

```

public class Util {
    void reassignInt(int j) {
        j = j + 1; }
    void reassignRef(Point q) {
        Point np = new Point(6, 8);
        q = np; }
    void changeViaRef(Point q) {
        q.moveHorizontally(3);
        q.moveVertically(4); } }
1  @Test
2  public void testCallByRef_2() {
3      Util u = new Util();
4      Point p = new Point(3, 4);
5      Point refOfPBefore = p;
6      u.changeViaRef(p);
7      assertTrue(p==refOfPBefore);
8      assertTrue(p.x==6 && p.y==8);
9  }
    
```

- **Before** the mutator call at L6, **reference** variable p stores the **address** of some Point object (whose x is 3 and y is 4).
- **When** executing the mutator call at L6, due to **call by value**, a **copy of address** stored in p is made. [Alias: p and q store same address.]
  - ⇒ Calls to q.moveHorizontally and q.moveVertically are effective on both p and q.
- ∴ **After** the mutator call at L6, variable p still stores the original address (i.e., same as refOfPBefore), but its x and y have been modified via q.

## Call by Value (2.4.2)

## Aggregation: Independent Containees Shared by Containers (1.1)

```
class Course {
    String title;
    Faculty prof;
    Course(String title) {
        this.title = title;
    }
    void setProf(Faculty prof) {
        this.prof = prof;
    }
    Faculty getProf() {
        return this.prof;
    }
}
```

```
class Faculty {
    String name;
    Faculty(String name) {
        this.name = name;
    }
    void setName(String name) {
        this.name = name;
    }
    String getName() {
        return this.name;
    }
}
```

## Aggregation vs. Composition: Terminology

- Container** object: an object that contains others.
- Containee** object: an object that is contained within another.
  - e.g., Each course has a faculty member as its instructor.
    - Container:** Course      **Containee:** Faculty.
  - e.g., Each student is registered in a list of courses; Each faculty member teaches a list of courses.
    - Container:** Student, Faculty      **Containees:** Course.
    - e.g., eeecs2030 taken by jim (student) and taught by tom (faculty).
    - ⇒ **Containees** may be **shared** by different instances of **containers**.
    - e.g., When EECS2030 is finished, jim and jackie still exist!
    - ⇒ **Containees** may exist **independently** without their **containers**.
  - e.g., In a file system, each directory contains a list of files.
    - Container:** Directory      **Containees:** File.
    - e.g., Each file has exactly one parent directory.
    - ⇒ A **containee** may be **owned** by only one **container**.
    - e.g., Deleting a directory also deletes the files it contains.
    - ⇒ **Containees** may **co-exist** with their **containers**.

## Aggregation: Independent Containees Shared by Containers (1.2)

```
@Test
public void testAggregation1() {
    Course eeecs2030 = new Course("Advanced OOP");
    Course eeecs3311 = new Course("Software Design");
    Faculty prof = new Faculty("Jackie");
    eeecs2030.setProf(prof);
    eeecs3311.setProf(prof);
    assertTrue(eeecs2030.getProf() == eeecs3311.getProf());
    /* aliasing */
    prof.setName("Jeff");
    assertTrue(eeecs2030.getProf() == eeecs3311.getProf());
    assertTrue(eeecs2030.getProf().getName().equals("Jeff"));

    Faculty prof2 = new Faculty("Jonathan");
    eeecs3311.setProf(prof2);
    assertTrue(eeecs2030.getProf() != eeecs3311.getProf());
    assertTrue(eeecs2030.getProf().getName().equals("Jeff"));
    assertTrue(eeecs3311.getProf().getName().equals("Jonathan"));
}
```

## Aggregation: Independent Containees Shared by Containers (2.1)

```

class Student {
    String id; ArrayList<Course> cs; /* courses */
    Student(String id) { this.id = id; cs = new ArrayList<>(); }
    void addCourse(Course c) { cs.add(c); }
    ArrayList<Course> getCS() { return cs; }
}
  
```

```

class Course { String title; }
  
```

```

class Faculty {
    String name; ArrayList<Course> te; /* teaching */
    Faculty(String name) { this.name = name; te = new ArrayList<>(); }
    void addTeaching(Course c) { te.add(c); }
    ArrayList<Course> getTE() { return te; }
}
  
```

13 of 33

## Aggregation: Independent Containees Shared by Containers (2.2)

```

@Test
public void testAggregation2() {
    Faculty p = new Faculty("Jackie");
    Student s = new Student("Jim");
    Course eecs2030 = new Course("Advanced OOP");
    Course eecs3311 = new Course("Software Design");
    eecs2030.setProf(p);
    eecs3311.setProf(p);
    p.addTeaching(eecs2030);
    p.addTeaching(eecs3311);
    s.addCourse(eecs2030);
    s.addCourse(eecs3311);

    assertTrue(eecs2030.getProf() == s.getCS().get(0).getProf());
    assertTrue(s.getCS().get(0).getProf() == s.getCS().get(1).getProf());
    assertTrue(eecs3311 == s.getCS().get(1));
    assertTrue(s.getCS().get(1) == p.getTE().get(1));
}
  
```

14 of 33

## The Dot Notation (3.1)

In real life, the relationships among classes are sophisticated.

```

class Student {
    String id;
    ArrayList<Course> cs;
}
  
```

```

class Course {
    String title;
    Faculty prof;
}
  
```

```

class Faculty {
    String name;
    ArrayList<Course> te;
}
  
```

**Aggregation links** between classes constrain how you can **navigate** among these classes.

e.g., In the context of class Student:

- Writing **cs** denotes the list of registered courses.
- Writing **cs[i]** (where *i* is a valid index) navigates to the class Course, which changes the context to class Course.

15 of 33

## The Dot Notation (3.2)

```

class Student {
    String id;
    ArrayList<Course> cs;
}
  
```

```

class Course {
    String title;
    Faculty prof;
}
  
```

```

class Faculty {
    String name;
    ArrayList<Course> te;
}
  
```

```

class Student {
    ... /* attributes */
    /* Get the student's id */
    String getID() { return this.id; }
    /* Get the title of the ith course */
    String getCourseTitle(int i) {
        return this.cs.get(i).title;
    }
    /* Get the instructor's name of the ith course */
    String getInstructorName(int i) {
        return this.cs.get(i).prof.name;
    }
}
  
```

16 of 33

## The Dot Notation (3.3)

```
class Student {
    String id;
    ArrayList<Course> cs;
}
```

```
class Course {
    String title;
    Faculty prof;
}
```

```
class Faculty {
    String name;
    ArrayList<Course> te;
}
```

```
class Course {
    ... /* attributes */
    /* Get the course's title */
    String getTitle() { return this.title; }
    /* Get the instructor's name */
    String getInstructorName() {
        return this.prof.name;
    }
    /* Get title of ith teaching course of the instructor */
    String getCourseTitleOfInstructor(int i) {
        return this.prof.te.get(i).title;
    }
}
```

17 of 33

## Composition: Dependent Containees Owned by Containers (1.1)

Assumption: Files are not shared among directories.

```
class File {
    String name;
    File(String name) {
        this.name = name;
    }
}
```

```
class Directory {
    String name;
    File[] files;
    int nof; /* num of files */
    Directory(String name) {
        this.name = name;
        files = new File[100];
    }
    void addFile(String fileName) {
        files[nof] = new File(fileName);
        nof++;
    }
}
```

19 of 33

## The Dot Notation (3.4)

```
class Student {
    String id;
    ArrayList<Course> cs;
}
```

```
class Course {
    String title;
    Faculty prof;
}
```

```
class Faculty {
    String name;
    ArrayList<Course> te;
}
```

```
class Faculty {
    ... /* attributes */
    /* Get the instructor's name */
    String getName() {
        return this.name;
    }
    /* Get the title of ith teaching course */
    String getCourseTitle(int i) {
        return this.te.get(i).title;
    }
}
```

18 of 33

## Composition: Dependent Containees Owned by Containers (1.2.1)

```
1 @Test
2 public void testComposition() {
3     Directory d1 = new Directory("D");
4     d1.addFile("f1.txt");
5     d1.addFile("f2.txt");
6     d1.addFile("f3.txt");
7     assertTrue(
8         d1.files[0].name.equals("f1.txt"));
9 }
```

- L4: 1st File object is created and **owned exclusively** by d1. No other directories are sharing this File object with d1.
- L5: 2nd File object is created and **owned exclusively** by d1. No other directories are sharing this File object with d1.
- L6: 3rd File object is created and **owned exclusively** by d1. No other directories are sharing this File object with d1.

20 of 33

## Composition: Dependent Containees Owned by Containers (1.2.2)

Right before test method `testComposition` terminates:

## Composition: Dependent Containees Owned by Containers (1.4.1)

Version 1: **Shallow Copy** by copying all attributes using =.

```
class Directory {
    Directory(Directory other) {
        /* value copying for primitive type */
        nof = other.nof;
        /* address copying for reference type */
        name = other.name; files = other.files; }
}
```

Is a shallow copy satisfactory to support composition?  
i.e., Does it still forbid sharing to occur? [NO]

```
@Test
void testShallowCopyConstructor() {
    Directory d1 = new Directory("D");
    d1.addFile("f1.txt"); d1.addFile("f2.txt"); d1.addFile("f3.txt");
    Directory d2 = new Directory(d1);
    assertTrue(d1.files == d2.files); /* violation of composition */
    d2.files[0].changeName("f11.txt");
    assertFalse(d1.files[0].name.equals("f1.txt")); }
}
```

## Composition: Dependent Containees Owned by Containers (1.3)

**Problem:** Implement a **copy constructor** for `Directory`.

A **copy constructor** is a constructor which initializes attributes from the argument object `other`.

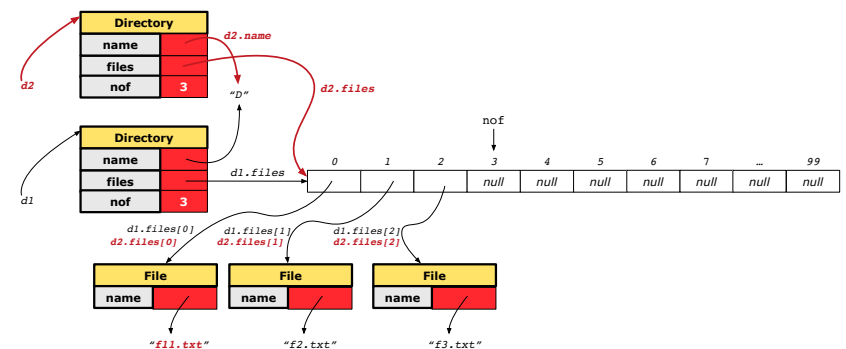

```
class Directory {
    Directory(Directory other) {
        /* Initialize attributes via attributes of 'other'. */
    }
}
```

### Hints:

- The implementation should be consistent with the effect of copying and pasting a directory.
- Separate copies of files are created.

## Composition: Dependent Containees Owned by Containers (1.4.2)

Right before test method `testShallowCopyConstructor` terminates:

## Composition: Dependent Containees Owned by Containers (1.5.1)

Version 2: a **Deep Copy**

```
class File {
    File(File other) {
        this.name =
            new String(other.name);
    }
}
```

```
class Directory {
    Directory(String name) {
        this.name = new String(name);
        files = new File[100];
    }
    Directory(Directory other) {
        this(other.name);
        for(int i = 0; i < nof; i++) {
            File src = other.files[i];
            File nf = new File(src);
            this.addFile(nf);
        }
        void addFile(File f) { ... }
    }
}
```

```
@Test
void testDeepCopyConstructor() {
    Directory d1 = new Directory("D");
    d1.addFile("f1.txt"); d1.addFile("f2.txt"); d1.addFile("f3.txt");
    Directory d2 = new Directory(d1);
    assertTrue(d1.files != d2.files); /* composition preserved */
    d2.files[0].changeName("f11.txt");
    assertTrue(d1.files[0].name.equals("f1.txt"));
}
```

25 of 33

## Composition: Dependent Containees Owned by Containers (1.5.3)

Q: Composition Violated?

```
class File {
    File(File other) {
        this.name =
            new String(other.name);
    }
}
```

```
class Directory {
    Directory(String name) {
        this.name = new String(name);
        files = new File[100];
    }
    Directory(Directory other) {
        this(other.name);
        for(int i = 0; i < nof; i++) {
            File src = other.files[i];
            this.addFile(src);
        }
        void addFile(File f) { ... }
    }
}
```

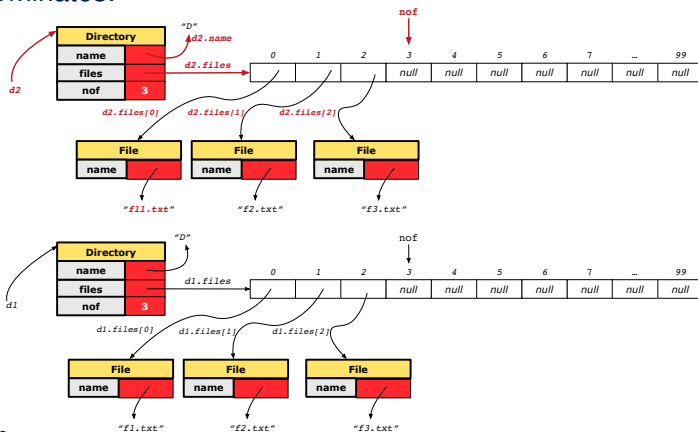

```
@Test
void testDeepCopyConstructor() {
    Directory d1 = new Directory("D");
    d1.addFile("f1.txt"); d1.addFile("f2.txt"); d1.addFile("f3.txt");
    Directory d2 = new Directory(d1);
    assertTrue(d1.files != d2.files); /* composition preserved */
    d2.files[0].changeName("f11.txt");
    assertTrue(d1.files[0] == d2.files[0]); /* composition violated! */
}
```

27 of 33

## Composition: Dependent Containees Owned by Containers (1.5.2)

Right before test method `testDeepCopyConstructor` terminates:

26 of 33

## Composition: Dependent Containees Owned by Containers (1.6)

Exercise: Implement the accessor in class `Directory`

```
class Directory {
    File[] files;
    int nof;
    File[] getFiles() {
        /* Your Task */
    }
}
```

so that it **preserves composition**, i.e., does not allow references of files to be shared.

28 of 33

## Aggregation vs. Composition (1)

Terminology:

- **Container** object: an object that contains others.
- **Containee** object: an object that is contained within another.

### Aggregation :

- Containees (e.g., Course) may be *shared* among containers (e.g., Student, Faculty).
- Containees *exist independently* without their containers.
- When a container is destroyed, its containees still exist.

### Composition :

- Containers (e.g, Directory, Department) *own* exclusive access to their containees (e.g., File, Faculty).
- Containees cannot exist without their containers.
- Destroying a container destroys its containees *cascadingly*.
