

Use of Generic Parameters

Iterator and Singleton Patterns

EECS3311 A: Software Design
Fall 2019

CHEN-WEI WANG

Generic Collection Class: Motivation (1)

```
class STRING_STACK
feature {NONE} -- Implementation
  imp: ARRAY[STRING] ; i: INTEGER
feature -- Queries
  count: INTEGER do Result := i end
    -- Number of items on stack.
  top: STRING do Result := imp [i] end
    -- Return top of stack.
feature -- Commands
  push (v: STRING) do imp[i] := v; i := i + 1 end
    -- Add 'v' to top of stack.
  pop do i := i - 1 end
    -- Remove top of stack.
end
```

- Does how we implement integer stack operations (e.g., top, push, pop) depends on features specific to element type **STRING** (e.g., at, append)? [**NO!**]
- How would you implement another class **ACCOUNT_STACK**?

Generic Collection Class: Motivation (2)

```
class ACCOUNT_STACK
feature {NONE} -- Implementation
  imp: ARRAY[ACCOUNT] ; i: INTEGER
feature -- Queries
  count: INTEGER do Result := i end
  -- Number of items on stack.
  top: ACCOUNT do Result := imp [i] end
  -- Return top of stack.
feature -- Commands
  push (v: ACCOUNT) do imp[i] := v; i := i + 1 end
  -- Add 'v' to top of stack.
  pop do i := i - 1 end
  -- Remove top of stack.
end
```

- Does how we implement integer stack operations (e.g., top, push, pop) depends on features specific to element type ACCOUNT (e.g., deposit, withdraw)? [**NO!**]
- A **collection** (e.g., table, tree, graph) is meant for the **storage** and **retrieval** of elements, not how those elements are manipulated.

Generic Collection Class: Supplier

- Your design “*smells*” if you have to create an *almost identical* new class (hence *code duplicates*) for every stack element type you need (e.g., INTEGER, CHARACTER, PERSON, etc.).
- Instead, as **supplier**, use **G** to *parameterize* element type:

```
class STACK [G]
feature {NONE} -- Implementation
  imp: ARRAY[G] ; i: INTEGER
feature -- Queries
  count: INTEGER do Result := i end
  -- Number of items on stack.
  top: G do Result := imp [i] end
  -- Return top of stack.
feature -- Commands
  push (v: G) do imp[i] := v; i := i + 1 end
  -- Add 'v' to top of stack.
  pop do i := i - 1 end
  -- Remove top of stack.
end
```

Generic Collection Class: Client (1.1)

As **client**, declaring `ss: STACK [STRING]` instantiates every occurrence of `G` as `STRING`.

```
class STACK [STRING]  
feature {NONE} -- Implementation  
  imp: ARRAY [STRING] ; i: INTEGER  
feature -- Queries  
  count: INTEGER do Result := i end  
    -- Number of items on stack.  
  top: STRING do Result := imp [i] end  
    -- Return top of stack.  
feature -- Commands  
  push (v: STRING) do imp[i] := v; i := i + 1 end  
    -- Add 'v' to top of stack.  
  pop do i := i - 1 end  
    -- Remove top of stack.  
end
```

Generic Collection Class: Client (1.2)

As **client**, declaring `ss: STACK [ACCOUNT]` instantiates every occurrence of `G` as `ACCOUNT`.

```
class STACK [ACCOUNT]
feature {NONE} -- Implementation
  imp: ARRAY [ACCOUNT] ; i: INTEGER
feature -- Queries
  count: INTEGER do Result := i end
  -- Number of items on stack.
  top: ACCOUNT do Result := imp [i] end
  -- Return top of stack.
feature -- Commands
  push (v: ACCOUNT) do imp[i] := v; i := i + 1 end
  -- Add 'v' to top of stack.
  pop do i := i - 1 end
  -- Remove top of stack.
end
```

Generic Collection Class: Client (2)

As **client**, instantiate the type of **G** to be the one needed.

```

1 test_stacks: BOOLEAN
2   local
3     ss: STACK[STRING] ; sa: STACK[ACCOUNT]
4     s: STRING ; a: ACCOUNT
5   do
6     ss.push("A")
7     ss.push(create {ACCOUNT}.make ("Mark", 200))
8     s := ss.top
9     a := ss.top
10    sa.push(create {ACCOUNT}.make ("Alan", 100))
11    sa.push("B")
12    a := sa.top
13    s := sa.top
14  end
  
```

- **L3** commits that `ss` stores `STRING` objects only.
 - **L8** and **L10** *valid*; **L9** and **L11** *invalid*.
- **L4** commits that `sa` stores `ACCOUNT` objects only.
 - **L12** and **L14** *valid*; **L13** and **L15** *invalid*.

What are design patterns?

- Solutions to *recurring problems* that arise when software is being developed within a particular *context*.
 - Heuristics for structuring your code so that it can be systematically maintained and extended.
 - **Caveat**: A pattern is only suitable for a particular problem.
 - Therefore, always understand *problems* before *solutions*!

Iterator Pattern: Motivation (1)

Supplier:

```
class
  CART
feature
  orders: ARRAY[ORDER]
end

class
  ORDER
feature
  price: INTEGER
  quantity: INTEGER
end
```

Problems?

Client:

```
class
  SHOP
feature
  cart: CART
  checkout: INTEGER
  do
    from
      i := cart.orders.lower
    until
      i > cart.orders.upper
    do
      Result := Result +
        cart.orders[i].price
        *
        cart.orders[i].quantity
      i := i + 1
    end
  end
end
end
```

Iterator Pattern: Motivation (2)

Supplier:

```
class
  CART
feature
  orders: LINKED_LIST[ORDER]
end

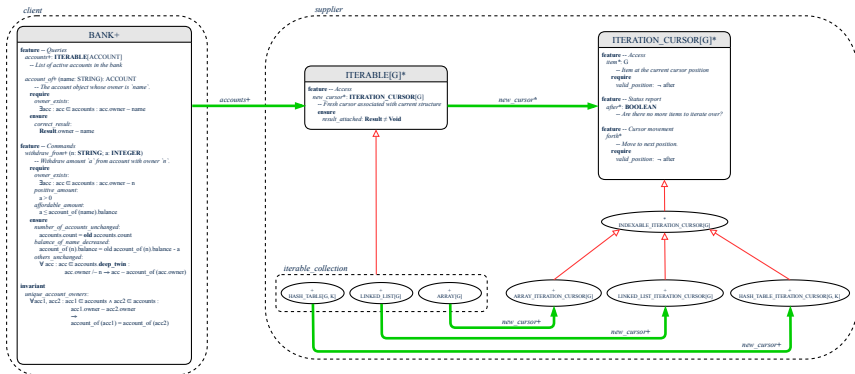

class
  ORDER
feature
  price: INTEGER
  quantity: INTEGER
end
```

Client's code must be modified to adapt to the supplier's *change on implementation*.

Client:

```
class
  SHOP
feature
  cart: CART
  checkout: INTEGER
do
  from
    cart.orders.start
  until
    cart.orders.after
do
  Result := Result +
    cart.orders.item.price
    *
    cart.orders.item.quantity
end
end
end
```

Iterator Pattern: Architecture

Iterator Pattern: Supplier's Side

- **Information Hiding Principle** :
 - Hide design decisions that are *likely to change* (i.e., *stable* API).
 - *Change of secrets* does not affect clients using the existing API.
e.g., changing from *ARRAY* to *LINKED_LIST* in the *CART* class
- Steps:
 1. Let the supplier class inherit from the deferred class *ITERABLE[G]*.
 2. This forces the supplier class to implement the inherited feature: *new_cursor: ITERATION_CURSOR [G]*, where the type parameter *G* may be instantiated (e.g., *ITERATION_CURSOR[ORDER]*).
 - 2.1 If the internal, library data structure is already *iterable* e.g., *imp: ARRAY[ORDER]*, then simply return *imp.new_cursor*.
 - 2.2 Otherwise, say *imp: MY_TREE[ORDER]*, then create a new class *MY_TREE_ITERATION_CURSOR* that inherits from *ITERATION_CURSOR[ORDER]*, then implement the 3 inherited features *after*, *item*, and *forth* accordingly.

Iterator Pattern: Supplier's Implementation (1)

```
class
  CART
inherit
  ITERABLE [ORDER]

...

feature {NONE} -- Information Hiding
  orders: ARRAY [ORDER]

feature -- Iteration
  new_cursor: ITERATION_CURSOR [ORDER]
  do
    Result := orders.new_cursor
  end
```

When the secrete implementation is already *iterable*, reuse it!

Iterator Pattern: Supplier's Imp. (2.1)

```
class
  GENERIC_BOOK[G]
inherit
  ITERABLE[ TUPLE[STRING, G] ]
...
feature {NONE} -- Information Hiding
  names: ARRAY[STRING]
  records: ARRAY[G]
feature -- Iteration
  new_cursor: ITERATION_CURSOR[ TUPLE[STRING, G] ]
  local
    cursor: MY_ITERATION_CURSOR[G]
  do
    create cursor.make (names, records)
    Result := cursor
  end
```

No Eiffel library support for iterable arrays ⇒ Implement it yourself!

Iterator Pattern: Supplier's Imp. (2.2)

```
class
  MY_ITERATION_CURSOR[G]
inherit
  ITERATION_CURSOR[ TUPLE[STRING, G] ]
feature -- Constructor
  make (ns: ARRAY[STRING]; rs: ARRAY[G])
    do ... end
feature {NONE} -- Information Hiding
  cursor_position: INTEGER
  names: ARRAY[STRING]
  records: ARRAY[G]
feature -- Cursor Operations
  item: TUPLE[STRING, G]
    do ... end
  after: Boolean
    do ... end
  forth
    do ... end
```

You need to implement the three inherited features:
item, *after*, and *forth*.

Iterator Pattern: Supplier's Imp. (2.3)

Visualizing iterator pattern at runtime:

1. Draw the BON diagram showing how the iterator pattern is applied to the *CART* (supplier) and *SHOP* (client) classes.
2. Draw the BON diagram showing how the iterator pattern is applied to the supplier classes:
 - *GENERIC_BOOK* (a descendant of *ITERABLE*) and
 - *MY_ITERATION_CURSOR* (a descendant of *ITERATION_CURSOR*).

- Tutorial Videos on Generic Parameters and the Iterator Pattern
- Tutorial Videos on Information Hiding and the Iterator Pattern

Iterator Pattern: Client's Side

Information hiding: the clients do not at all depend on *how* the supplier implements the collection of data; they are only interested in iterating through the collection in a linear manner.

Steps:

1. Obey the **code to interface, not to implementation** principle.
2. Let the client declare an attribute of **interface** type **ITERABLE[G]** (rather than **implementation** type **ARRAY**, **LINKED_LIST**, or **MY_TREE**).
e.g., `cart: CART`, where **CART** inherits **ITERABLE[ORDER]**
3. Eiffel supports, in both implementation and **contracts**, the **across** syntax for iterating through anything that's *iterable*.

Iterator Pattern: Clients using across for Contracts (1)

```
class
  CHECKER
  feature -- Attributes
    collection: ITERABLE [INTEGER]
  feature -- Queries
    is_all_positive: BOOLEAN
      -- Are all items in collection positive?
    do
      ...
    ensure
      across
        collection is item
      all
        item > 0
      end
    end
end
```

- Using **all** corresponds to a universal quantification (i.e., \forall).
- Using **some** corresponds to an existential quantification (i.e., \exists).

Iterator Pattern: Clients using across for Contracts (2)

```
class BANK
...
  accounts: LIST [ACCOUNT]
  binary_search (acc_id: INTEGER): ACCOUNT
    -- Search on accounts sorted in non-descending order.
    require
      across
        1 |..| (accounts.count - 1) is i
      all
        accounts [i].id <= accounts [i + 1].id
      end
    do
      ...
    ensure
      Result.id = acc_id
    end
```

This precondition corresponds to:

$\forall i: \text{INTEGER} \mid 1 \leq i < \text{accounts.count} \bullet \text{accounts}[i].\text{id} \leq \text{accounts}[i+1].\text{id}$

Iterator Pattern: Clients using across for Contracts (3)

```
class BANK
...
  accounts: LIST [ACCOUNT]
  contains_duplicate: BOOLEAN
    -- Does the account list contain duplicate?
  do
    ...
  ensure
     $\forall i, j: \text{INTEGER} \mid$ 
       $1 \leq i \leq \text{accounts.count} \wedge 1 \leq j \leq \text{accounts.count} \bullet$ 
       $\text{accounts}[i] \sim \text{accounts}[j] \Rightarrow i = j$ 
  end
```

- **Exercise:** Convert this mathematical predicate for postcondition into Eiffel.
- **Hint:** Each **across** construct can only introduce one dummy variable, but you may nest as many **across** constructs as necessary.

Iterator Pattern: Clients using Iterable in Imp. (1)

```
class BANK
  accounts: ITERABLE [ACCOUNT]
  max_balance: ACCOUNT
  -- Account with the maximum balance value.
  require ??
  local
    cursor: ITERATION_CURSOR[ACCOUNT]; max: ACCOUNT
  do
    from max := accounts [1]; cursor := accounts.new_cursor
  until cursor.after
  do
    if cursor.item.balance > max.balance then
      max := cursor.item
    end
    cursor.forth
  end
ensure ??
end
```

Iterator Pattern: Clients using Iterable in Imp. (2)

```
1 class SHOP
2   cart: CART
3   checkout: INTEGER
4   -- Total price calculated based on orders in the cart.
5   require ??
6   do
7     across
8       cart is order
9     loop
10      Result := Result + order.price * order.quantity
11    end
12  ensure ??
13 end
```

- Class *CART* should inherit from *ITERABLE[ORDER]*.
- **L10** implicitly declares `cursor: ITERATION_CURSOR[ORDER]` and does `cursor := cart.new_cursor`

Iterator Pattern: Clients using Iterable in Imp. (3)

```
class BANK
  accounts: ITERABLE [ACCOUNT]
  max_balance: ACCOUNT
  -- Account with the maximum balance value.
  require ??
  local
    max: ACCOUNT
  do
    max := accounts [1]
  across
    accounts is acc
  loop
    if acc.balance > max.balance then
      max := acc
    end
  end
ensure ??
end
```

Expanded Class: Modelling

- We may want to have objects which are:
 - Integral parts of some other objects
 - **Not** shared among objects

e.g., Each workstation has its own CPU, monitor, and keyboard.
All workstations share the same network.

Expanded Class: Programming (2)

```
class KEYBOARD ... end class CPU ... end  
class MONITOR ... end class NETWORK ... end  
class WORKSTATION  
  k: expanded KEYBOARD  
  c: expanded CPU  
  m: expanded MONITOR  
  n: NETWORK  
end
```

Alternatively:

```
expanded class KEYBOARD ... end  
expanded class CPU ... end  
expanded class MONITOR ... end  
class NETWORK ... end  
class WORKSTATION  
  k: KEYBOARD  
  c: CPU  
  m: MONITOR  
  n: NETWORK  
end
```

Expanded Class: Programming (3)

```
expanded class
  B
feature
  change_i (ni: INTEGER)
  do
    i := ni
  end
feature
  i: INTEGER
end
```

```
1 test_expanded: BOOLEAN
2   local
3     eb1, eb2: B
4   do
5     Result := eb1.i = 0 and eb2.i = 0
6     check Result end
7     Result := eb1 = eb2
8     check Result end
9     eb2.change_i (15)
10    Result := eb1.i = 0 and eb2.i = 15
11    check Result end
12    Result := eb1 /= eb2
13    check Result end
14  end
```

- **L5:** object of expanded type is automatically initialized.
- **L9 & L10:** no sharing among objects of expanded type.
- **L7 & L12:** = between expanded objects compare their contents.

Reference vs. Expanded (1)

- Every entity must be declared to be of a certain type (based on a class).
- Every type is either *referenced* or *expanded*.
- In *reference* types:
 - y denotes *a reference* to some object
 - $x := y$ attaches x to same object as does y
 - $x = y$ compares references
- In *expanded* types:
 - y denotes *some object* (of expanded type)
 - $x := y$ copies contents of y into x
 - $x = y$ compares contents

$[x \sim y]$

Reference vs. Expanded (2)

Problem: Every published book has an author. Every author may publish more than one books. Should the author field of a book *reference*-typed or *expanded*-typed?

reference-typed author

expanded-typed author

Physical printed copies

Singleton Pattern: Motivation

Consider two problems:

1. **Bank accounts** share a set of data.
e.g., interest and exchange rates, minimum and maximum balance, *etc.*
2. **Processes** are regulated to access some shared, limited resources.
e.g., printers

Shared Data via Inheritance

Descendant:

```
class DEPOSIT inherit SHARED_DATA
  -- 'maximum_balance' relevant
end

class WITHDRAW inherit SHARED_DATA
  -- 'minimum_balance' relevant
end

class INT_TRANSFER inherit SHARED_DATA
  -- 'exchange_rate' relevant
end

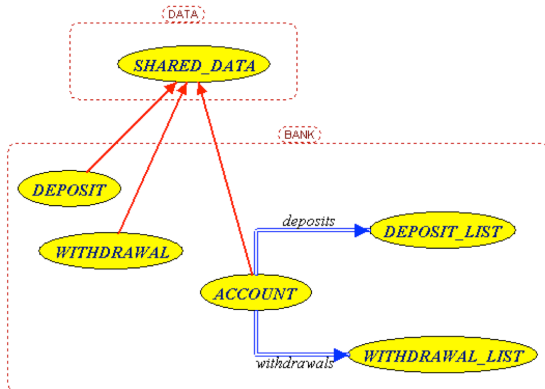

class ACCOUNT inherit SHARED_DATA
feature
  -- 'interest_rate' relevant
  deposits: DEPOSIT_LIST
  withdraws: WITHDRAW_LIST
end
```

Ancestor:

```
class
  SHARED_DATA
feature
  interest_rate: REAL
  exchange_rate: REAL
  minimum_balance: INTEGER
  maximum_balance: INTEGER
  ...
end
```

Problems?

Sharing Data via Inheritance: Architecture

- *Irreverent* features are inherited.
⇒ Descendants' **cohesion** is broken.
- Same set of data is *duplicated* as instances are created.
⇒ Updates on these data may result in **inconsistency**.

Sharing Data via Inheritance: Limitation

- Each descendant instance at runtime owns a separate copy of the shared data.
- This makes inheritance *not* an appropriate solution for both problems:
 - What if the interest rate changes? Apply the change to all instantiated account objects?
 - An update to the global lock must be observable by all regulated processes.

Solution:

- Separate notions of *data* and its *shared access* in two separate classes.
- *Encapsulate* the shared access itself in a separate class.

Introducing the Once Routine in Eiffel (1.1)

```
1 class A
2 create make
3 feature -- Constructor
4   make do end
5 feature -- Query
6   new_once_array (s: STRING): ARRAY[STRING]
7     -- A once query that returns an array.
8     once
9       create {ARRAY[STRING]} Result.make_empty
10      Result.force (s, Result.count + 1)
11    end
12   new_array (s: STRING): ARRAY[STRING]
13     -- An ordinary query that returns an array.
14     do
15       create {ARRAY[STRING]} Result.make_empty
16       Result.force (s, Result.count + 1)
17     end
18 end
```

L9 & L10 executed **only once** for initialization.

L15 & L16 executed **whenever** the feature is called.

Introducing the Once Routine in Eiffel (1.2)

```
1 test_query: BOOLEAN
2   local
3     a: A
4     arr1, arr2: ARRAY[STRING]
5   do
6     create a.make
7
8     arr1 := a.new_array ("Alan")
9     Result := arr1.count = 1 and arr1[1] ~ "Alan"
10    check Result end
11
12    arr2 := a.new_array ("Mark")
13    Result := arr2.count = 1 and arr2[1] ~ "Mark"
14    check Result end
15
16    Result := not (arr1 = arr2)
17    check Result end
18  end
```

Introducing the Once Routine in Eiffel (1.3)

```
1 test_once_query: BOOLEAN
2   local
3     a: A
4     arr1, arr2: ARRAY[STRING]
5   do
6     create a.make
7
8     arr1 := a.new_once_array ("Alan")
9     Result := arr1.count = 1 and arr1[1] ~ "Alan"
10    check Result end
11
12    arr2 := a.new_once_array ("Mark")
13    Result := arr2.count = 1 and arr2[1] ~ "Alan"
14    check Result end
15
16    Result := arr1 = arr2
17    check Result end
18 end
```

Introducing the Once Routine in Eiffel (2)

```
r (...): T
  once
    -- Some computations on Result
    ...
  end
```

- The ordinary **do ... end** is replaced by **once ... end**.
- The first time the **once** routine *r* is called by some client, it executes the body of computations and returns the computed result.
- From then on, the computed result is “*cached*”.
- In every subsequent call to *r*, possibly by different clients, the body of *r* is not executed at all; instead, it just returns the “*cached*” result, which was computed in the very first call.
- **How does this help us?**

Cache the reference to the same shared object !

Approximating Once Routine in Java (1)

We may encode Eiffel once routines in Java:

```
class BankData {  
    BankData() { }  
    double interestRate;  
    void setIR(double r);  
    ...  
}
```

```
class Account {  
    BankData data;  
    Account() {  
        data = BankDataAccess.getData();  
    }  
}
```

```
class BankDataAccess {  
    static boolean initOnce;  
    static BankData data;  
    static BankData getData() {  
        if(!initOnce) {  
            data = new BankData();  
            initOnce = true;  
        }  
        return data;  
    }  
}
```

Problem?

Multiple **BankData** objects may be created in Account, breaking the singleton!

```
Account() {  
    data = new BankData();  
}
```

Approximating Once Routine in Java (2)

We may encode Eiffel once routines in Java:

```
class BankData {
    private BankData() { }
    double interestRate;
    void setIR(double r);
    static boolean initOnce;
    static BankData data;
    static BankData getData() {
        if(!initOnce) {
            data = new BankData();
            initOnce = true;
        }
        return data;
    }
}
```

Problem?

Loss of Cohesion: **Data**
and **Access to Data** are
two separate concerns,
so should be decoupled
into two different classes!

Singleton Pattern in Eiffel (1)

Supplier:

```
class DATA
create {DATA_ACCESS} make
feature {DATA_ACCESS}
  make do v := 10 end
feature -- Data Attributes
  v: INTEGER
  change_v (nv: INTEGER)
    do v := nv end
end
```

```
expanded class
  DATA_ACCESS
feature
  data: DATA
  -- The one and only access
  once create Result.make end
invariant data = data
```

Client:

```
test: BOOLEAN
  local
    access: DATA_ACCESS
    d1, d2: DATA
  do
    d1 := access.data
    d2 := access.data
    Result := d1 = d2
    and d1.v = 10 and d2.v = 10
  check Result end
  d1.change_v (15)
  Result := d1 = d2
  and d1.v = 15 and d2.v = 15
end
end
```

Writing `create d1.make` in test feature does not compile. Why?

Singleton Pattern in Eiffel (2)

Supplier:

```
class BANK_DATA
  create {BANK_DATA_ACCESS} make
  feature {BANK_DATA_ACCESS}
    make do ... end
  feature -- Data Attributes
    interest_rate: REAL
    set_interest_rate (r: REAL)
    ...
end
```

```
expanded class
  BANK_DATA_ACCESS
  feature
    data: BANK_DATA
    -- The one and only access
    once create Result.make end
  invariant data = data
```

Client:

```
class
  ACCOUNT
  feature
    data: BANK_DATA
    make (...)
    -- Init. access to bank data.
  local
    data_access: BANK_DATA_ACCESS
  do
    data := data_access.data
    ...
  end
end
```

Writing `create data.make` in client's `make` feature does not compile. Why?

Testing Singleton Pattern in Eiffel

```
test_bank_shared_data: BOOLEAN
  -- Test that a single data object is manipulated
  local acc1, acc2: ACCOUNT
  do
    comment("t1: test that a single data object is shared")
    create acc1.make ("Bill")
    create acc2.make ("Steve")
    Result := acc1.data = acc2.data
    check Result end
    Result := acc1.data ~ acc2.data
    check Result end
    acc1.data.set_interest_rate (3.11)
    Result :=
      acc1.data.interest_rate = acc2.data.interest_rate
      and acc1.data.interest_rate = 3.11
    check Result end
    acc2.data.set_interest_rate (2.98)
    Result :=
      acc1.data.interest_rate = acc2.data.interest_rate
      and acc1.data.interest_rate = 2.98
  end
```

Singleton Pattern: Architecture

Important Exercises: Instantiate this architecture to both problems of shared bank data and shared lock. Draw them in

draw.io.
