Case Study: Abstraction of a Birthday Book

EECS3311 A & E: Software Design Fall 2020

CHEN-WEI WANG

Learning Objectives

Upon completing this lecture, you are expected to understand:

- 1. Asserting Set Equality in Postconditions (Exercise)
- **2.** The basics of discrete math (Self-Guided Study) FUN is a REL, but not vice versa.
- 3. Creating a *mathematical abstraction* for a birthday book
- **4.** Using commands and queries from two mathmodels classes: REL and FUN

Math Review: Set Definitions and Membershipson

- A set is a collection of objects.
 - Objects in a set are called its elements or members.
 - Order in which elements are arranged does not matter.
 - An element can appear at most once in the set.
- We may define a set using:
 - Set Enumeration: Explicitly list all members in a set. e.g., {1,3,5,7,9}
 - Set Comprehension: Implicitly specify the condition that all members satisfy.

[true]

[true]

- e.g., $\{x \mid 1 \le x \le 10 \land x \text{ is an odd number}\}$
- An empty set (denoted as {} or ∅) has no members.
- We may check if an element is a *member* of a set:
 e.g., 5 ∈ {1,3,5,7,9}

e.g.,
$$4 \notin \{x \mid x \le 1 \le 10, x \text{ is an odd number}\}$$

• The number of elements in a set is called its *cardinality*.

e.g.,
$$|\emptyset| = 0$$
, $|\{x \mid x \le 1 \le 10, x \text{ is an odd number}\}| = 5$

Math Review: Set Relations

Given two sets S_1 and S_2 :

• S_1 is a *subset* of S_2 if every member of S_1 is a member of S_2 .

$$S_1 \subseteq S_2 \iff (\forall x \bullet x \in S_1 \Rightarrow x \in S_2)$$

• S_1 and S_2 are *equal* iff they are the subset of each other.

$$S_1 = S_2 \iff S_1 \subseteq S_2 \land S_2 \subseteq S_1$$

• S_1 is a *proper subset* of S_2 if it is a strictly smaller subset.

$$S_1 \subset S_2 \iff S_1 \subseteq S_2 \land |S1| < |S2|$$

Math Review: Set Operations

Given two sets S_1 and S_2 :

• Union of S_1 and S_2 is a set whose members are in either.

$$S_1 \cup S_2 = \{x \mid x \in S_1 \lor x \in S_2\}$$

• *Intersection* of S_1 and S_2 is a set whose members are in both.

$$S_1 \cap S_2 = \{x \mid x \in S_1 \land x \in S_2\}$$

 Difference of S₁ and S₂ is a set whose members are in S₁ but not S₂.

$$S_1 \setminus S_2 = \{x \mid x \in S_1 \land x \notin S_2\}$$

Math Review: Power Sets

The *power set* of a set *S* is a *set* of all *S' subsets*.

$$\mathbb{P}(S) = \{ s \mid s \subseteq S \}$$

The power set contains subsets of *cardinalities* 0, 1, 2, ..., |S|. e.g., $\mathbb{P}(\{1,2,3\})$ is a set of sets, where each member set s has cardinality 0, 1, 2, or 3:

$$\left\{ \begin{array}{l} \varnothing, \\ \{1\}, \ \{2\}, \ \{3\}, \\ \{1,2\}, \ \{2,3\}, \ \{3,1\}, \\ \{1,2,3\} \end{array} \right\}$$

Math Review: Set of Tuples

Given n sets S_1, S_2, \ldots, S_n , a *cross product* of theses sets is a set of n-tuples.

Each n-tuple (e_1, e_2, \dots, e_n) contains n elements, each of which a member of the corresponding set.

$$S_1 \times S_2 \times \cdots \times S_n = \{(e_1, e_2, \dots, e_n) \mid e_i \in S_i \land 1 \le i \le n\}$$

e.g., $\{a,b\} \times \{2,4\} \times \{\$,\&\}$ is a set of triples:

$$\{a,b\} \times \{2,4\} \times \{\$,\&\}$$

$$= \{ (e_1,e_2,e_3) \mid e_1 \in \{a,b\} \land e_2 \in \{2,4\} \land e_3 \in \{\$,\&\} \}$$

$$= \{ (a,2,\$), (a,2,\&), (a,4,\$), (a,4,\&),$$

$$(b,2,\$), (b,2,\&), (b,4,\$), (b,4,\&) \}$$

Math Models: Relations (1)

- A <u>relation</u> is a collection of mappings, each being an <u>ordered</u> pair that maps a member of set S to a member of set T.
 e.g., Say S = {1,2,3} and T = {a,b}
 - ∘ Ø is an empty relation.
 - $S \times T$ is a relation (say r_1) that maps from each member of S to each member in T: $\{(1, a), (1, b), (2, a), (2, b), (3, a), (3, b)\}$
 - ∘ $\{(x,y): S \times T \mid x \neq 1\}$ is a relation (say r_2) that maps only some members in S to every member in $T: \{(2,a),(2,b),(3,a),(3,b)\}$.
- Given a relation r:
 - Domain of r is the set of S members that r maps from.

$$dom(r) = \{s : S \mid (\exists t \bullet (s, t) \in r)\}$$

e.g., $dom(r_1) = \{1, 2, 3\}, dom(r_2) = \{2, 3\}$

Range of r is the set of T members that r maps to.

$$\operatorname{ran}(r) = \{t : T \mid (\exists s \bullet (s, t) \in r)\}$$
 e.g.,
$$\operatorname{ran}(r_1) = \{a, b\} = \operatorname{ran}(r_2)$$

Math Models: Relations (2)

 We use the power set operator to express the set of all possible relations on S and T:

$$\mathbb{P}(S \times T)$$

 To declare a relation variable r, we use the colon (:) symbol to mean set membership:

$$r: \mathbb{P}(S \times T)$$

Or alternatively, we write:

$$r: S \leftrightarrow T$$

where the set $S \leftrightarrow T$ is synonymous to the set $\mathbb{P}(S \times T)$

Math Models: Relations (3.1)

Say
$$r = \{(a,1), (b,2), (c,3), (a,4), (b,5), (c,6), (d,1), (e,2), (f,3)\}$$

- r.domain: set of first-elements from r
 - \circ r.**domain** = { $d \mid (d, r) \in r$ }
 - e.g., r.**domain** = $\{a, b, c, d, e, f\}$
- r.range: set of second-elements from r
 - ∘ r.**range** = $\{ r | (d, r) \in r \}$
 - \circ e.g., r.**range** = $\{1, 2, 3, 4, 5, 6\}$
- [r.inverse]: a relation like r except elements are in reverse order
 - ∘ r.inverse = $\{ (r, d) | (d, r) \in r \}$
 - e.g., r.**inverse** = $\{(1, a), (2, b), (3, c), (4, a), (5, b), (6, c), (1, d), (2, e), (3, f)\}$

LASSONDE SCHOOL OF ENGINEERING

Math Models: Relations (3.2)

```
Say r = \{(a,1), (b,2), (c,3), (a,4), (b,5), (c,6), (d,1), (e,2), (f,3)\}
```

- r.domain_restricted(ds) : sub-relation of r with domain ds.
 - ∘ r.domain_restricted(ds) = $\{ (d,r) \mid (d,r) \in r \land d \in ds \}$
 - $\circ \text{ e.g., r.domain_restricted}(\{a,b\}) = \{(\boldsymbol{a},1), (\boldsymbol{b},2), (\boldsymbol{a},4), (\boldsymbol{b},5)\}$
- $| r.domain_subtracted(ds) | : sub-relation of r with domain <math>\underline{not} ds$.
 - o r.domain_subtracted(ds) = { $(d,r) | (d,r) ∈ r ∧ d \notin ds$ }
 - e.g., r.domain_subtracted({a, b}) =
 {(c, 3) (c, 6) (d, 1) (e, 2) (f, 3)}
 - $\{(\mathbf{c},3),(\mathbf{c},6),(\mathbf{d},1),(\mathbf{e},2),(\mathbf{f},3)\}$
- r.range_restricted(rs): sub-relation of r with range rs.
 - ∘ r.range_restricted(rs) = $\{ (d,r) | (d,r) \in r \land r \in rs \}$
 - e.g., r.range_restricted($\{1, 2\}$) = $\{(a, 1), (b, 2), (d, 1), (e, 2)\}$
- $r.range_subtracted(ds)$: sub-relation of r with range not ds.
 - $\overline{\circ}$ r.range_subtracted(rs) = $\{ (d,r) \mid (d,r) \in r \land r \notin rs \}$
 - e.g., r.range_subtracted($\{1, 2\}$) = $\{\{(c, 3), (a, 4), (b, 5), (c, 6), (f, 3)\}\}$

Math Models: Relations (3.3)

Say
$$r = \{(a,1), (b,2), (c,3), (a,4), (b,5), (c,6), (d,1), (e,2), (f,3)\}$$

• r. overridden(t): a relation which agrees on r outside domain of t.domain, and agrees on t within domain of t.domain

∘ r.overridden(t) = $t \cup r$.domain_subtracted(t.domain)

$$r.\mathbf{overridden}(\underbrace{\{(a,3),(c,4)\}}_{t}) \\ = \underbrace{\{(a,3),(c,4)\}}_{t} \cup \underbrace{\{(b,2),(b,5),(d,1),(e,2),(f,3)\}}_{r.\mathsf{domain_subtracted}(\underbrace{t.\mathsf{domain}}_{\{a,c\}}) \\ = \{(a,3),(c,4),(b,2),(b,5),(d,1),(e,2),(f,3)\}$$

0

Math Review: Functions (1)

A *function* f on sets S and T is a *specialized form* of relation: it is forbidden for a member of S to map to more than one members of T.

$$\forall s: S; t_1: T; t_2: T \bullet (s, t_1) \in f \land (s, t_2) \in f \Rightarrow t_1 = t_2$$

e.g., Say $S = \{1, 2, 3\}$ and $T = \{a, b\}$, which of the following relations are also functions?

\circ $S \times T$	[No]
$\circ (S \times T) - \{(x,y) \mid (x,y) \in S \times T \land x = 1\}$	[No]
$\circ \{(1,a),(2,b),(3,a)\}$	[Yes]
$\circ \{(1,a),(2,b)\}$	[Yes]

 We use set comprehension to express the set of all possible functions on S and T as those relations that satisfy the functional property:

$$\{r: S \leftrightarrow T \mid (\forall s: S; t_1: T; t_2: T \bullet (s, t_1) \in r \land (s, t_2) \in r \Rightarrow t_1 = t_2) \}$$

- This set (of possible functions) is a subset of the set (of possible relations): P(S × T) and S ↔ T.
- We abbreviate this set of possible functions as S → T and use it to declare a function variable f:

$$f: S \rightarrow T$$

Math Review: Functions (3.1)

Given a function $f: S \rightarrow T$:

 f is injective (or an injection) if f does not map two members of S to the same member of T.

```
f is injective \iff (\forall s_1: S; s_2: S; t: T \bullet (s_1, t) \in r \land (s_2, t) \in r \Rightarrow s_1 = s_2)
```

e.g., Considering an array as a function from integers to objects, being injective means that the array does not contain any duplicates.

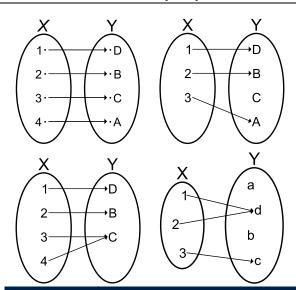

• *f* is *surjective* (or a surjection) if *f* maps to all members of *T*.

$$f$$
 is surjective \iff ran $(f) = T$

• *f* is *bijective* (or a bijection) if *f* is both injective and surjective.

Math Review: Functions (3.2)

Math Models: Command-Query Separation

Command	Query
domain_restrict	domain_restrict ed
domain_restrict_by	domain_restrict ed_ by
domain_subtract	domain_subtract ed
domain_subtract_by	domain_subtract ed _by
range_restrict	range_restrict ed
range_restrict_by	range_restrict ed _by
range_subtract	range_subtract ed
range_subtract_by	range_subtract ed _by
override	overrid den
override_by	overrid den _by

Say
$$r = \{(a,1), (b,2), (c,3), (a,4), (b,5), (c,6), (d,1), (e,2), (f,3)\}$$

Commands modify the context relation objects.

r. domain_restrict ({a}) changes r to $\{(a,1),(a,4)\}$

Queries return new relations without modifying context objects.

r. domain_restricted ({a}) returns $\{(a,1),(a,4)\}$ with r untouched

Math Models: Example Test

```
test rel: BOOLEAN
 local
  r, t: REL[STRING, INTEGER]
  ds: SET[STRING]
 do
   create r.make from tuple array (
    <<["a", 1], ["b", 2], ["c", 3],
      ["a", 4], ["b", 5], ["c", 6],
      ["d", 1], ["e", 2], ["f", 3]>>)
   create ds.make from arrav (<<"a">>>)
   -- r is not changed by the query 'domain subtracted'
   t := r.domain_subtracted (ds)
  Result :=
    t /~ r and not t.domain.has ("a") and r.domain.has ("a")
   check Result end
   -- r is changed by the command 'domain subtract'
   r.domain_subtract (ds)
  Result :=
    t ~ r and not t.domain.has ("a") and not r.domain.has ("a")
 end
```

Case Study: A Birthday Book

- A birthday book stores a collection of entries, where each entry is a pair of a person's name and their birthday.
- No two entries stored in the book are allowed to have the same name.
- Each birthday is characterized by a month and a day.
- A birthday book is first created to contain an empty collection of entires.
- Given a birthday book, we may:
 - Inquire about the number of entries currently stored in the book
 - Add a new entry by supplying its name and the associated birthday
 - Remove the entry associated with a particular person
 - Find the birthday of a particular person
 - Get a reminder list of names of people who share a given birthday

Birthday Book: Decisions

- Design Decision
 - Classes
 - Client Supplier vs. Inheritance
 - Mathematical Model?

[e.g., REL or FUN]

- Contracts
- Implementation Decision
 - Two linear structures (e.g., arrays, lists)

[O(*n*)]

A balanced search tree (e.g., AVL tree)

 $[O(log \cdot n)]$

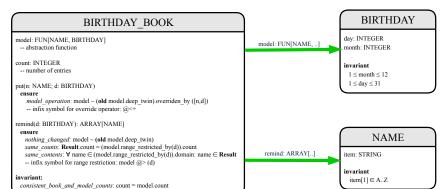

A hash table

[O(1)]

• Implement an *abstraction function* that maps implementation to the math model.

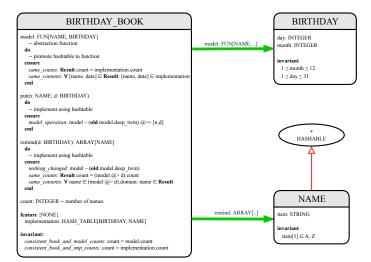

Birthday Book: Implementation

Beyond this lecture ...

 Familiarize yourself with the features of class REL, FUN, and SET.

• Exercise:

- Consider an alternative implementation using two linear structures (e.g., here in Java).
- Implement the design of birthday book covered in lectures.
- Create another LINEAR_BIRTHDAY_BOOK class and modify the implementation of abstraction function accordingly.
 Do all contracts still pass? What should change? What remain unchanged?
