

## Lecture 11 - Oct. 19

### Object Equality.

***To Override or Not to Override  
Overriding equals: 4 Phases***

## Announcements

- Lab2 due this Friday
- Look ahead: WrittenTest2 & ProgTest2

+ Important Exercise:

Use debugger to explore execution paths  
in the console testers & JUnit tests

int i = ... ;

int j = ... ;

i == j

① each class has one parent class

② each class may have multiple child classes

Compare primitive value

```

class Object {
    : equals
}
  
```

class parent class

super

Person p1 = new ... ;

Person p2 = ... ;

p1 == p2

obj. equals(obj2)

↳ this

↳ obj.

↳ compare address values

Inheritance

```

class Person {
    :
}
  
```

↳ anything in Object inherited / accumulated to any class

↳ Java library class

- classes in project.

child class / sub class

$x == y$

①  $x, y$  are primitive vars.

②  $x, y$  are ref vars.

<sup>c.o.</sup>  
①  $x.equals(y)$

①  $x, y$  are ref var

# The equals Method: To **Override** or **Not**?

```
public class Object {  
    ...  
    public boolean equals(Object obj) {  
        return this == obj;  
    }  
}
```

default version inherited to every class

extends

extends

default equals inherited

```
public class PointV1 {  
    private double x;  
    private double y;  
    public PointV1 (double x, double y) {  
        this.x = x;  
        this.y = y;  
    }  
}
```

```
public class PointV2 {  
    private int x; private int y;  
    public PointV2 (int x, int y) { ... }  
    public boolean equals(Object obj) {  
        if(this == obj) { return true; }  
        if(obj == null) { return false; }  
        if(this.getClass() != obj.getClass()) { return false }  
        Point other = (PointV2) obj;  
        return this.x == other.x  
            && this.y == other.y;  
    }  
}
```

overrides/redefines the default version

# The equals Method: Default Version

S → "(2, 3)"

```
public class Object {
    ...
    public boolean equals(Object obj) {
        return this == obj;
    }
}
```

```
1 String s = "(2, 3)";
2 PointV1 p1 = new PointV1(2, 3);
3 PointV1 p2 = new PointV1(2, 3);
4 PointV1 p3 = new PointV1(4, 6);
5 System.out.println(p1 == p2); /* false */
6 System.out.println(p2 == p3); /* false */
7 System.out.println(p1.equals(p1)); /* true */
8 System.out.println(p1.equals(null)); /* false */
9 System.out.println(p1.equals(s)); /* false */
10 System.out.println(p1.equals(p2)); /* false */
11 System.out.println(p2.equals(p3)); /* false */
```

extends

```
public class PointV1 {
    private int x;
    private int y;
    public PointV1 (int x, int y) {
        this.x = x;
        this.y = y;
    }
}
```

Strategy  
① Find out the type of obj the l.a.

② See which version of equals.

p1 →

p2 →

p3 →

- ① boils down: p1 == s (F)
- ② p1 == s

# The equals Method: Overridden Version

Phase 1

```
public class Object {  
    ...  
    public boolean equals(Object obj) {  
        return this == obj;  
    }  
}
```

extends

```
public class PointV2 {  
    private int x;  
    private int y;  
    public PointV2(int x, int y) { ... }  
    public boolean equals(Object obj) {  
        if (this == obj) { return true; }  
        if (obj == null) { return false; }  
        if (this.getClass() != obj.getClass()) { return false }  
        Point other = (PointV2) obj;  
        return this.x == other.x  
            && this.y == other.y;  
    }  
}
```

PointV2 p1 = new PointV2(...) ;  
p1.equals(...);  
C.O. v. dynamic  
to of type  
PointV2  
↳ overridden  
version is called

p2 = p1;  
p1.equals(p2) ;  
↓  
same equals meth.  
is overridden,  
call that version.

# The equals Method: Overridden Version

Phase 2

Have we missed:  
 $p1 \rightsquigarrow null$

```
public class Object {
    ...
    public boolean equals(Object obj) {
        return this == obj;
    }
}
```

$p2 \rightsquigarrow null$   
 if  $(this == null \ \&\& \ obj == null)$

```
public class PointV2 {
    private int x;
    private int y;
    public PointV2(int x, int y) { ... }
    public boolean equals(Object obj) {
        if (this == obj) { return true; }
        if (obj == null) { return false; }
        if (this.getClass() != obj.getClass()) { return false; }
        Point other = (PointV2) obj;
        return this.x == other.x
            && this.y == other.y;
    }
}
```

reaching this line means  $this != obj$

extends  
 & return true

no need to consider  
 $this == null$   
 - a NPE would've occurred

Scenario 1:  $p1 \neq p2$  and  $p2$  is not null  
 more to phase 3

PointV2	
x	
y	

PointV2	
x	
y	

$p1.equals(p2)$

Scenario 2

PointV2	
x	
y	

(A non-null object is not equal to a null obj)

PointV2	
x	
y	

$p2 \rightarrow null$

# The equals Method: Overridden Version

Phase 3

```
public class Object {  
    ...  
    public boolean equals(Object obj) {  
        return this == obj;  
    }  
}
```

extends

```
public class PointV2 {  
    private int x;  
    private int y;  
    public PointV2(int x, int y) { ... }  
    public boolean equals(Object obj) {  
        if (this == obj) { return true; }  
        if (obj == null) { return false; }  
        if (this.getClass() != obj.getClass()) { return false; }  
        Point other = (PointV2) obj;  
        return this.x == other.x  
            && this.y == other.y;  
    }  
}
```

repeating this line means:  
1. this != obj  
2. obj != null

Pl. getClass()  
!=  
S. getClass()

String

Pl: comparing objects of diff. types

S ~> "Pl"  
Pl. equals (S);

returns the dynamic type of the C.O.  
(2) Title of the object box pointed to by C.O.

# The equals Method: Overridden Version

Phase 4

```
public class Object {  
    ...  
    public boolean equals(Object obj) {  
        return this == obj;  
    }  
}
```

this

obj

```
public class PointV2 {  
    private int x;  
    private int y;  
    public PointV2(int x, int y) { ... }  
    public boolean equals(Object obj) {  
        if(this == obj) { return true; }  
        if(obj == null) { return false; }  
        if(this.getClass() != obj.getClass()) { return false }  
        Point other = (PointV2) obj;  
        return this.x == other.x  
            && this.y == other.y;  
    }  
}
```

extends

static type  
restricts range

the of methods that can be called on 'obj'

this.x == obj.x  
&& this.y == obj.y

we can only invoke methods that declared in the ST of obj.  
x, y only declared

review up to true by Monday

reaching this true means:  
① this != null  
② obj != null  
③ comparing objects of the same type
