

## Lecture 14 - Nov. 1

### Visitor, Syntactic Analysis

***Visitor: Double Dispatch***

***Visitor: Open-Closed Principle***

***Visitor: Single-Choice Principle***

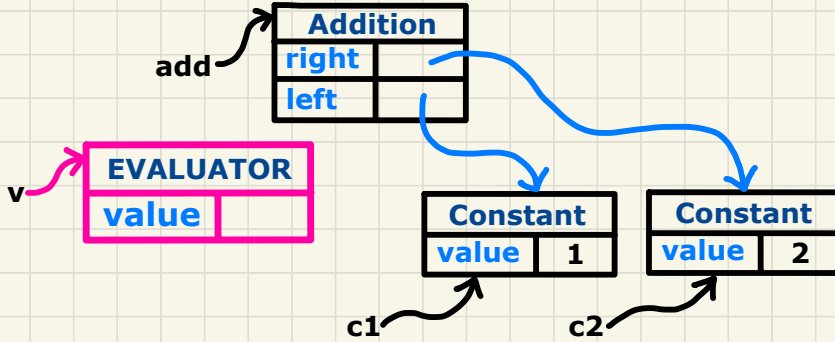

## Announcements

- **Assignment 2** released
  - + Python script for **Regression Testing**
- **Project Milestone 1** due next week
  - + Sign-Up sheet activated tomorrow (Wednesday) at 6pm

# Executing Composite and Visitor Patterns at Runtime

DT

Tracing add.accept(v)  
Double Dispatch

DT

```

public class Constant implements Expression {
    ...
    public void accept(Visitor v) {
        v.visitConstant(this);
    }
}
    
```

```

public class Addition extends CompositeExpression {
    ...
    public void accept(Visitor v) {
        v.visitAddition(this);
    }
}
    
```

```

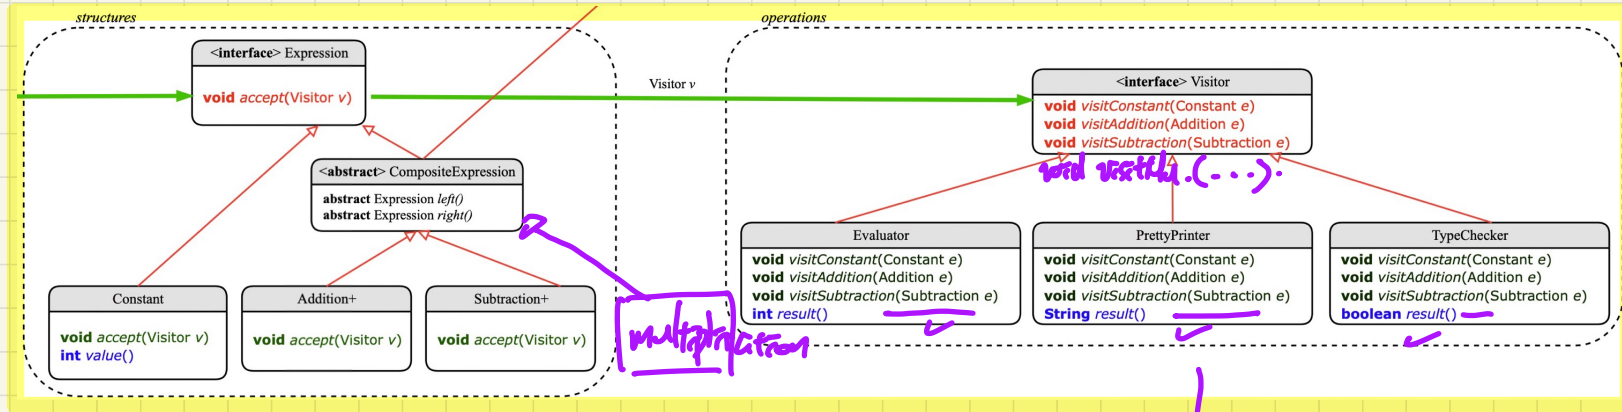

public interface Visitor {
    public void visitConstant(Constant e);
    public void visitAddition(Addition e);
    public void visitSubtraction(Subtraction e);
}
    
```

```

public class Evaluator implements Visitor {
    private int result;
    ...
    public void visitConstant(Constant e) {
        this.result = e.value();
    }
    public void visitAddition(Addition e) {
        Evaluator evalL = new Evaluator();
        Evaluator evalR = new Evaluator();
        e.getLeft().accept(evalL);
        e.getRight().accept(evalR);
        this.result = evalL.result() + evalR.result();
    }
}
    
```

# Visitor Pattern: **Open-Closed** and **Single-Choice** Principles

What if a **new language construct** is added?

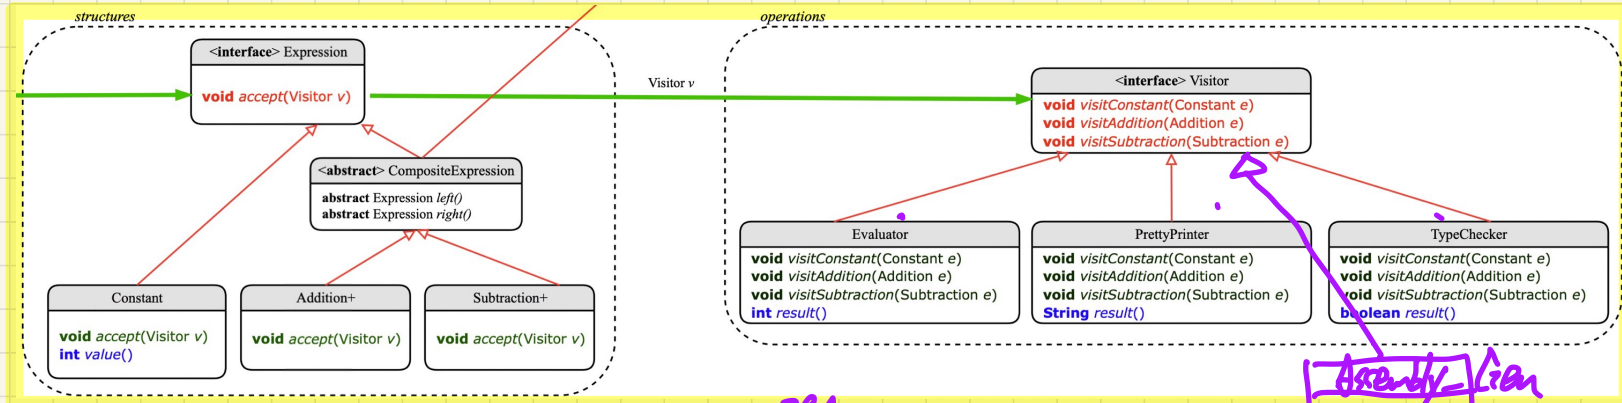

↳ unsuitable for visitor pattern

If the **visitor pattern** is adopted, what should be **closed**?

structure: open  
operation: closed

↳ violates sep.

# Visitor Pattern: Open-Closed and Single-Choice Principles

*operations: open  
structures: closed*

*Assembly Line*

What if a **new language operation** is added?

If the **visitor pattern** is adopted, what should be **open**?

*For this single place,  
implement all visit methods  
↳ SCP satisfied*
