Recommender Systems: Content-based Systems & Collaborative Filtering

Thanks to
Jure Leskovec, Anand Rajaraman, Jeff Ullman
http://www.mmds.org
Overview of Recommender Systems
Content-based Systems
Collaborative Filtering
Example: Recommender Systems

- **Customer X**
  - Buys Metallica CD
  - Buys Megadeth CD

- **Customer Y**
  - Does search on Metallica
  - Recommender system suggests Megadeth from data collected about customer X

Recommender systems build on search:}

Examples:

- Amazon.com
- Pandora
- StumbleUpon
- del.icio.us
- Netflix
- MovieLens
- Last.fm
- Google News
- YouTube
- Xbox Live

From Scarcity to Abundance

- **Shelf space is a scarce commodity for traditional retailers**
  - Also: TV networks, movie theaters,...

- **Web enables near-zero-cost dissemination of information about products**
  - From scarcity to abundance

- **More choice necessitates better filters**
  - Recommendation engines
  - How *Into Thin Air* made *Touching the Void* a bestseller: [http://www.wired.com/wired/archive/12.10/tail.html](http://www.wired.com/wired/archive/12.10/tail.html)
Sidenote: The Long Tail

The New Growth Market: Obscure Products You Can’t Get Anywhere But Online

Songs available at both Wal-Mart and Rhapsody

Songs available only on Rhapsody

Sources: Erik Brynjolfsson and Jeffrey Hu, MIT, and Michael Smith, Carnegie Mellon; Barnes & Noble; Netflix; RealNetworks

Source: Chris Anderson (2004)
Physical vs. Online

THE BIT PLAYER ADVANTAGE
Beyond bricks and mortar there are two main retail models – one that gets halfway down the Long Tail and another that goes all the way. The first is the familiar hybrid model of Amazon and Netflix, companies that sell physical goods online. Digital catalogs allow them to offer unlimited selection along with search, reviews, and recommendations, while the cost savings of massive warehouses and no walk-in customers greatly expands the number of products they can sell profitably.

Pushing this even further are pure digital services, such as iTunes, which offer the additional savings of delivering their digital goods online at virtually no marginal cost. Since an extra database entry and a few megabytes of storage on a server cost effectively nothing, these retailers have no economic reason not to carry everything available.

"IF YOU LIKE BRITNEY, YOU’LL LOVE ..."
Just as lower prices can entice consumers down the Long Tail, recommendation engines drive them to obscure content they might not find otherwise.

Source: Amazon.com

Types of Recommendations

- Editorial and hand curated
  - List of favorites
  - Lists of “essential” items

- Simple aggregates
  - Top 10, Most Popular, Recent Uploads

- Tailored to individual users
  - Amazon, Netflix, ...
Formal Model

- $X = \text{set of Customers}$
- $S = \text{set of Items}$

- **Utility function** $u: X \times S \rightarrow R$
  - $R = \text{set of ratings}$
  - $R$ is a totally ordered set
  - e.g., 0-5 stars, real number in $[0,1]$
## Utility Matrix

<table>
<thead>
<tr>
<th></th>
<th>Avatar</th>
<th>LOTR</th>
<th>Matrix</th>
<th>Pirates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alice</td>
<td>1</td>
<td>0.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Bob</td>
<td>0.5</td>
<td>0.3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Carol</td>
<td>0.2</td>
<td>1</td>
<td></td>
<td>0.4</td>
</tr>
<tr>
<td>David</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Key Problems

1. **Gathering “known” ratings for matrix**
   - How to collect the data in the utility matrix

2. **Extrapolate unknown ratings from the known ones**
   - Mainly interested in high unknown ratings
     - We are not interested in knowing what you don’t like but what you like

3. **Evaluating extrapolation methods**
   - How to measure success/performance of recommendation methods
(1) Gathering Ratings

- **Explicit**
  - Ask people to rate items
  - Doesn’t work well in practice – people can’t be bothered

- **Implicit**
  - Learn ratings from user actions
    - E.g., purchase implies high rating
  - What about low ratings?
(2) Extrapolating Utilities

- **Key problem**: Utility matrix $U$ is sparse
  - Most people have not rated most items
  - **Cold start**:
    - New items have no ratings
    - New users have no history

- **Three approaches to recommender systems**:
  - 1) Content-based
  - 2) Collaborative
  - 3) Latent factor based

Content-based Recommender Systems
Main idea: Recommend items to customer $x$ similar to previous items rated highly by $x$

Example:

- Movie recommendations
  - Recommend movies with same actor(s), director, genre, ...
- Websites, blogs, news
  - Recommend other sites with “similar” content
Plan of Action

User profile

Item profiles

Red
Circles
Triangles

match

build

likes

recommend
Item Profiles

- For each item, create an item profile

- Profile is a set (vector) of features
  - **Movies**: author, title, actor, director, ...
  - **Text**: Set of “important” words in document

- How to pick important features?
  - Usual heuristic from text mining is **TF-IDF**
    (Term frequency * Inverse Doc Frequency)
    - Term ... Feature
    - Document ... Item

Sidenote: TF-IDF

\[ f_{ij} = \text{frequency of term (feature) } i \text{ in doc (item) } j \]

\[ TF_{ij} = \frac{f_{ij}}{\max_k f_{kj}} \]

\[ n_i = \text{number of docs that mention term } i \]
\[ N = \text{total number of docs} \]

\[ IDF_i = \log \frac{N}{n_i} \]

TF-IDF score: \[ w_{ij} = TF_{ij} \times IDF_i \]

Doc profile = set of words with highest TF-IDF scores, together with their scores

**Note:** we normalize TF to discount for “longer” documents.
User Profiles and Prediction

- **User profile possibilities:**
  - Weighted average of rated item profiles
  - **Variation:** weight by difference from average rating for item
  - ...

- **Prediction heuristic:**
  - Given user profile $x$ and item profile $i$, estimate
  \[ u(x, i) = \cos(x, i) = \frac{x \cdot i}{||x|| \cdot ||i||} \]
Pros: Content-based Approach

- +: No need for data on other users
  - No cold-start or sparsity problems
- +: Able to recommend to users with unique tastes
- +: Able to recommend new & unpopular items
  - No first-rater problem
- +: Able to provide explanations
  - Can provide explanations of recommended items by listing content-features that caused an item to be recommended
Cons: Content-based Approach

- Finding the appropriate features is hard
  - E.g., images, movies, music
- Recommendations for new users
  - How to build a user profile?
- Overspecialization
  - Never recommends items outside user’s content profile
  - People might have multiple interests
  - Unable to exploit quality judgments of other users

Collaborative Filtering

Harnessing quality judgments of other users
Collaborative Filtering

- Consider user $x$
- Find set $N$ of other users whose ratings are “similar” to $x$’s ratings
- Estimate $x$’s ratings based on ratings of users in $N$
Let \( r_x \) be the vector of user \( x \)'s ratings

- **Jaccard similarity measure**
  - **Problem:** Ignores the value of the rating

- **Cosine similarity measure**
  - \( \text{sim}(x, y) = \cos(r_x, r_y) = \frac{r_x \cdot r_y}{\|r_x\| \cdot \|r_y\|} \)
  - **Problem:** Treats missing ratings as “negative”

- **Pearson correlation coefficient**
  - \( S_{xy} = \) items rated by both users \( x \) and \( y \)
  - \( \text{sim}(x, y) = \frac{\sum_{s \in S_{xy}} (r_{xs} - \bar{r}_x)(r_{ys} - \bar{r}_y)}{\sqrt{\sum_{s \in S_{xy}} (r_{xs} - \bar{r}_x)^2} \sqrt{\sum_{s \in S_{xy}} (r_{ys} - \bar{r}_y)^2}} \)

\( r_x, r_y \) as sets:
- \( r_x = \{1, 4, 5\} \)
- \( r_y = \{1, 3, 4\} \)

\( r_x, r_y \) as points:
- \( r_x = \{1, 0, 0, 1, 3\} \)
- \( r_y = \{1, 0, 2, 2, 0\} \)
Similarity Metric

Intuitively we want: \( \text{sim}(A, B) > \text{sim}(A, C) \)

Jaccard similarity: \( \frac{1}{5} < \frac{2}{4} \)

Cosine similarity: \( 0.386 > 0.322 \)

- Considers missing ratings as "negative"
- Solution: subtract the (row) mean

<table>
<thead>
<tr>
<th></th>
<th>HP1</th>
<th>HP2</th>
<th>HP3</th>
<th>TW</th>
<th>SW1</th>
<th>SW2</th>
<th>SW3</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>4</td>
<td>5</td>
<td>5</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>5</td>

</tr>
</tbody>
</table>

\[
\text{Cosine sim: } \quad \text{sim}(x, y) = \frac{\sum_i r_{xi} \cdot r_{yi}}{\sqrt{\sum_i r_{xi}^2 \cdot \sum_i r_{yi}^2}}
\]

\( \text{sim} A,B \) vs. \( A,C \): 
\( \frac{2}{3} > \frac{-2}{3} \) 

Notice cosine sim. is correlation when data is centered at 0
From similarity metric to recommendations:

- Let \( r_x \) be the vector of user \( x \)'s ratings
- Let \( N \) be the set of \( k \) users most similar to \( x \) who have rated item \( i \)

Prediction for item \( s \) of user \( x \):

\[
\begin{align*}
\hat{r}_{xi} &= \frac{1}{k} \sum_{y \in N} r_{yi} \\
\hat{r}_{xi} &= \frac{\sum_{y \in N} s_{xy} \cdot r_{yi}}{\sum_{y \in N} s_{xy}}
\end{align*}
\]

Other options?

Many other tricks possible...
**Item-Item Collaborative Filtering**

- **So far:** User-user collaborative filtering
- **Another view:** Item-item
  - For item $i$, find other similar items
  - Estimate rating for item $i$ based on ratings for similar items
  - Can use same similarity metrics and prediction functions as in user-user model

\[
\begin{align*}
r_{xi} &= \frac{\sum_{j \in N(i;x)} s_{ij} \cdot r_{xj}}{\sum_{j \in N(i;x)} s_{ij}} \\
\end{align*}
\]

- $s_{ij}$... similarity of items $i$ and $j$
- $r_{xj}$...rating of user $u$ on item $j$
- $N(i;x)$... set items rated by $x$ similar to $i$

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Neighbor selection:**
Identify movies similar to movie 1, rated by user 5

**Here we use Pearson correlation as similarity:**

1) Subtract mean rating \( m_i \) from each movie \( i \)
\[
m_1 = \frac{(1+3+5+5+4)}{5} = 3.6
\]

2) Compute cosine similarities between rows

**Item-Item CF (|N|=2)**

<table>
<thead>
<tr>
<th>movies</th>
<th>users</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td>3</td>
</tr>
<tr>
<td>7</td>
<td>5</td>
</tr>
<tr>
<td>8</td>
<td>5</td>
</tr>
<tr>
<td>9</td>
<td>4</td>
</tr>
<tr>
<td>10</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
</tbody>
</table>

**Compute similarity weights:**

\[ s_{1,3} = 0.41, \ s_{1,6} = 0.59 \]
## Item-Item CF (|N|=2)

Predict by taking weighted average:

\[ r_{1.5} = \frac{(0.41 \times 2) + (0.59 \times 3)}{0.41 + 0.59} = 2.6 \]

---

**Users**

<table>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Movies**

\[ r_{ix} = \frac{\sum_{j \in N(i;x)} s_{ij} \cdot r_{jx}}{\sum s_{ij}} \]
Define similarity \( s_{ij} \) of items \( i \) and \( j \)

Select \( k \) nearest neighbors \( N(i; x) \)
  - Items most similar to \( i \), that were rated by \( x \)

Estimate rating \( r_{xi} \) as the weighted average:

\[
 r_{xi} = b_{xi} + \frac{\sum_{j \in N(i; x)} s_{ij} \cdot (r_{xj} - b_{xj})}{\sum_{j \in N(i; x)} s_{ij}}
\]

baseline estimate for \( r_{xi} \)

\[
b_{xi} = \mu + b_{x} + b_{i}
\]

- \( \mu \) = overall mean movie rating
- \( b_{x} \) = rating deviation of user \( x \)
  
  \( = (\text{avg. rating of user } x) - \mu \)
- \( b_{i} \) = rating deviation of movie \( i \)
## Item-Item vs. User-User

<table>
<thead>
<tr>
<th></th>
<th>Avatar</th>
<th>LOTR</th>
<th>Matrix</th>
<th>Pirates</th>
</tr>
</thead>
<tbody>
<tr>

<td>1</td>
<td>0.8</td>
<td></td>
</tr>
<tr>
<td>David</td>
<td>1</td>
<td>0.4</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **In practice, it has been observed that item-item often works better than user-user**
- **Why?** Items are simpler, users have multiple tastes
Pros/Cons of Collaborative Filtering

+ Works for any kind of item
  - No feature selection needed

- Cold Start:
  - Need enough users in the system to find a match

- Sparsity:
  - The user/ratings matrix is sparse
  - Hard to find users that have rated the same items

- First rater:
  - Cannot recommend an item that has not been previously rated
  - New items, Esoteric items

- Popularity bias:
  - Cannot recommend items to someone with unique taste
  - Tends to recommend popular items
Hybrid Methods

- Implement two or more different recommenders and combine predictions
  - Perhaps using a linear model

- Add content-based methods to collaborative filtering
  - Item profiles for new item problem
  - Demographics to deal with new user problem
Remarks & Practical Tips

- Evaluation
- Error metrics
- Complexity / Speed
Evaluation

A matrix representation showing the evaluation of users' movie preferences:

```
(users) 1 3 4
         3 5 5
         4 5 5
         3
         3
         2 2 2
         3
         1
         3
         1
```

movies
## Evaluation

This slide illustrates a test data set for evaluation purposes. The data set is represented as a 5x5 grid, with rows labeled as users and columns as movies. The grid is divided into two sections: orange for known ratings and light gray for unknown ratings.

### Known Ratings
- Users: 1, 2, 3, 4, 5
- Movies: 1, 2, 3, 4, 5

### Unknown Ratings
- Users: 1, 2, 3
- Movies: 2, 3

This grid serves as a sample test data set for evaluating recommendation systems or other algorithms that rely on user-movie ratings.
Evaluating Predictions

- **Compare predictions with known ratings**
  - **Root-mean-square error (RMSE)**
    - \[ \sqrt{\sum_{x_i}(r_{xi} - r_{xi}^*)^2} \] where \( r_{xi} \) is predicted, \( r_{xi}^* \) is the true rating of \( x \) on \( i \)
  - **Precision at top 10:**
    - % of those in top 10
  - **Rank Correlation:**
    - Spearman’s *correlation* between system’s and user’s complete rankings

- **Another approach: 0/1 model**
  - **Coverage:**
    - Number of items/users for which system can make predictions
  - **Precision:**
    - Accuracy of predictions
  - **Receiver operating characteristic (ROC)**
    - Tradeoff curve between false positives and false negatives
Problems with Error Measures

- Narrow focus on accuracy sometimes misses the point
  - Prediction Diversity
  - Prediction Context
  - Order of predictions

- In practice, we care only to predict high ratings:
  - RMSE might penalize a method that does well for high ratings and badly for others
Expensive step is finding *k* most similar customers: $O(|X|)$

**Too expensive to do at runtime**
- Could pre-compute
- Naïve pre-computation takes time $O(k \cdot |X|)$
  - $X$ ... set of customers

**Efficient methods for finding *k* most similar customers**
- Near-neighbor search in high dimensions (*LSH*)
- Clustering
- Dimensionality reduction
Tip: Add Data

- Leverage all the data
  - Don’t try to reduce data size in an effort to make fancy algorithms work
  - Simple methods on large data do best

- Add more data
  - e.g., add IMDB data on genres

- More data beats better algorithms
