UNDERGRADUATE COURSES DEVELOPED

TERM/YEAR	COURSE CODE	COURSE NAME & DESCRIPTION
FALL 2016	EECS 4414	**INFORMATION NETWORKS** Information networks are effective representations of pairwise relationships between objects. Examples include technological networks (e.g., World Wide Web), online social networks (e.g., Facebook), biological networks (e.g., Protein-to-Protein interactions), and more. The study of information networks is an emerging discipline of immense importance that combines graph theory, probability and statistics, data mining and analysis, and computational social science. This course provides students with both theoretical knowledge and practical experience of the field by covering models and algorithms of information networks and their basic properties. In addition, analysis of information networks provides the means to explore large, complex data coming from vastly diverse sources and to inform computational problems and better decisions.
FALL 2016	EECS 4415	**BIG DATA SYSTEMS** Storing, managing, and processing datasets is foundational to both computer science and data science. The enormous size of today's data sets — and the specific requirements of modern applications — necessitated the growth of a new generation of data management systems, where the emphasis is put on distributed and fault-tolerant processing. New programming paradigms have evolved, an abundance of information platforms offering data management and analysis solutions have appeared, and a number of novel methods and tools have been developed. This course introduces the fundamentals of big-data storage, retrieval, and processing systems. As these fundamentals are introduced, exemplary technologies are used to illustrate how big data systems can leverage very large data sets that become available through multiple sources and are characterized by diverse levels of volume (terabytes, billion records), velocity (batch, real-time, and streaming), and variety (structured, semi-structured, and unstructured). The course aims to provide students with both theoretical knowledge and practical experience of the field by covering recent research on big-data systems and their basic properties. Students consider both small and large datasets because both are equally important and justify different trade-offs.

LEADERSHIP

2023 – 2024	**Program Committee Co-Chair, IEEE MDM 2024**
	As a co-chair of the program committee, I was responsible for the final scientific program of the IEEE MDM 2024 conference, hosted in Brussels, Belgium.
2021 – 2022	**Advanced Seminars Co-Chair, IEEE MDM 2022**

As a co-chair of advanced seminars committee, I coordinated the invitation and host of high caliber researchers and scientist to IEEE MDM 2022, which was hosted online.

2019 – 2021	**Local Organizing Committee, IEEE MDM 2021**

As a member of a local organizing committee, I coordinated the successful efforts to host the 22ⁿᵈ IEEE International Conference on Mobile Data Management (IEEE MDM 2021) in Toronto, Canada. In particular, I brought a team together, coordinated organizing efforts, prepared the bidding slide deck and delivered the bidding presentation to the conference steering committee. The IEEE MDM series of conferences, since its debut in 1999, has established itself as a prestigious forum for the exchange of innovative and significant research results in mobile data management. The conference provides unique opportunities to bring researchers, engineers, and practitioners together to explore new ideas, techniques, and tools, and exchange experiences. Comprising both research and industry tracks, it serves as an important bridge between academic researchers and industry researchers. Along with the presentations of research publications, it also serves as a meeting place for technical demonstrations, workshops, advanced seminars, panel discussions as well as PhD forum and Industrial forum to cater PhD students and industrial developers. The conference focuses on research contributions in data management in mobile, ubiquitous and pervasive computing.

2017 – 2019	**New Graduate Program, Proposal Lead, Professional Master of Data Science Program**

The Lassonde School of Engineering (in collaboration with other Faculties at York University) has prepared a proposal for a new Professional Master of Data Science program. The program is designed to meet a rapidly growing demand for professionals who can work effectively with data at scale – data scientists – and to train leaders in data science that can assume key positions in business, government, or non-profit organizations. When I joined York University, I was tasked by the Chair of the Department (Prof. Richard Wildes) to prepare a proposal for a new Professional Master of Data Science program. The proposal was reviewed and proof-read by the Chair of the department. The program is still at works, with efforts now coordinated at the Faculty level.

2017 – 2019	**New Undergraduate Program, Member of Working Group, Industrial BSc Program**

The EECS department has developed an industry partnership option for the Honours B.A. and Honours B.Sc. programs in computer science. Part of the education for students in this option is delivered through experiential learning at an industry partner's site. An industry partnership option allows students to receive a complete academic education, while at the same time gain valuable work experience that will enhance their knowledge on technical issues and improve their post-graduation employability.

2017 – 2018	**New Markham Center Campus (MCC), Member of Working Group, EECS @ Markham**

York University is in the process of establishing a new campus in Markham named Markham Center Campus (MCC), with a planned opening date of fall 2023 (originally planned for Fall 2021). With a planned initial target size of 4,000 students and a long-term planned size of 20,000, Information Technology is touted as one of the key program concentrations at this new campus. Planning for Markham has been underway for some time, and Lassonde is part of the planning process. The EECS department established a working group to respond to this opportunity. The goal of this document is to provide a short 'white paper' to put forth both the constraints and opportunities present at Markham, and to help frame the EECS response to this opportunity.
