

 arg is reference type (e.g., String, Point, Person, etc.): *Call by Value*: Copy of arg's stored reference/address (e.g., Point@5cb0d902) is made and passed.

3 of 37

Learning Outcomes

This module is designed to help you learn about:

- Call by Value: Primitive vs. Reference Argument Values
- Aggregation vs. Composition: Terminology and Modelling
- Aggregation: Building Sharing Links & Navigating Objects
- Composition: Implementation via Copy Constructors
- Design Decision : Aggregation or Composition?

Call by Value (2.1)

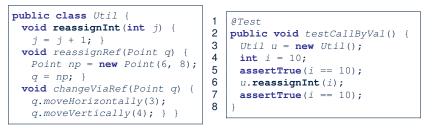

LASSONDE

For illustration, let's assume the following variant of the ${\tt Point}$ class:

```
public class Point {
    private int x;
    private int y;
    public Point(int x, int y) {
        this.x = x;
        this.y = y;
    }
    public int getX() { return this.x; }
    public int getY() { return this.y; }
    public void moveVertically(int y) { this.y += y; }
    public void moveHorizontally(int x) { this.x += x; }
```

Call by Value (2.2.1)

- *Before* the mutator call at L6, *primitive* variable i stores 10.
- When executing the mutator call at L6, due to call by value, a copy of variable i is made.
 - \Rightarrow The assignment i = i + 1 is only effective on this copy, not the original variable i itself.
- .: After the mutator call at L6, variable i still stores 10.

5 of 37

1 @Test public class Util { 2 public void testCallByRef_1() { void reassignInt(int j) { 3 Util u = new Util(); j = j + 1; } 4 Point p = new Point(3, 4);void reassignRef(Point q) { 5 Point refOfPBefore = p; Point np = new Point(6, 8); 6 u.reassignRef(p); 7 assertTrue(p == refOfPBefore); void changeViaRef(Point q) { 8 assertTrue(p.getX() == 3); q.moveHorizontally(3); 9 assertTrue(p.getY() == 4);

• Before the mutator call at L6, reference variable p stores the address of some Point object (whose x is 3 and y is 4).

10

• When executing the mutator call at L6, due to call by value, a

copy of address stored in p is made.

Call by Value (2.3.1)

q.moveVertically(4); } }

q = np; }

- \Rightarrow The assignment p = np is only effective on this copy, not the original variable p itself.
- .: After the mutator call at L6, variable p still stores the original address (i.e., same as refOfPBefore).

```

Aggregation: Independent Containees Shared by Containers (2.1)

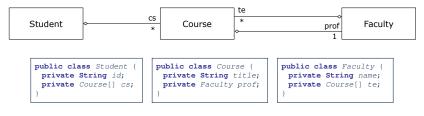

The Dot Notation (3.1)

LASSONDE

In real life, the relationships among classes are sophisticated.

- <u>Assume</u>: *private* attributs and *public* accessors
- *Aggregation links* between classes constrain how you can *navigate* among these classes.
- In the context of class Student:
 - Writing *cs* denotes the array of registered courses.
 - Writing *cs[i]* (where i is a valid index) navigates to the class Course, which changes the context to class Course.

```
16 of 37
```

OOP: The Dot Notation (3.2)

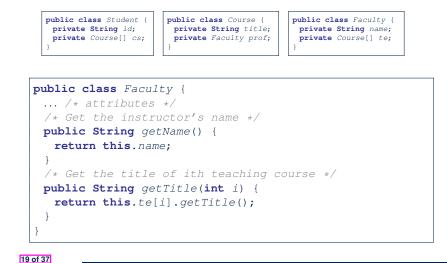

LASSONDE

OOP: The Dot Notation (3.4)

LASSONDE

OOP: The Dot Notation (3.3)

public class Student { private String id; private Course[] cs;

18 of 37

public class Course { public class Faculty { private String title; private Faculty prof;

private String name; private Course[] te;

public class Course ... /* attributes */ /* Get the course's title */ public String getTitle() { return this.title; } /* Get the instructor's name */ public String getName() { return this.prof.getName(); /* Get title of ith teaching course of the instructor */ public String getTitle(int i) { return this.prof.getTE()[i].getTitle(); }

Composition: Dependent Containees Owned by Containers (1.1)

Requirement: Files are not shared among directories.

Assume: *private* attributs and *public* accessors class File { String name: File(String name) { this.name = name;

class Directory { String name; File[] files; int nof; /* num of files */ Directory(String name) { this.name = name; files = new File[100]; void addFile(String fileName) files[nof] = new File(fileName); nof ++;

20 of 37

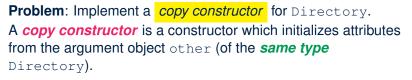

}

Composition: Dependent Containees Owned by Containers (1.2.1)

- L4: 1st File object is created and owned exclusively by d1. No other directories are sharing this File object with d1.
- L5: 2nd File object is created and owned exclusively by d1. No other directories are sharing this File object with d1.
- L6: 3rd File object is created and owned exclusively by d1. No other directories are sharing this File object with d1. 21 of 37

Composition: Dependent Containees Owned by Containers (1.3)

LASSONDE

LASSONDE

[**NO**]

class Directory {

```
Directory (Directory other) {
  /* Initialize attributes via attributes of 'other'. */
```

Hints:

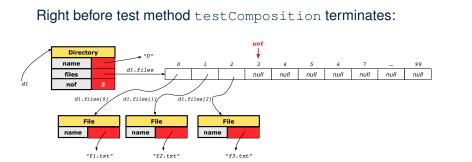

24 of 37

LASSONDE

LASSONDE

- The implementation should be consistent with the effect of copying and pasting a directory.
- · Separate copies of files are created. 23 of 37

Composition: Dependent Containees Owned by Containers (1.2.2)

Version 1: Shallow Copy by copying all attributes using =.

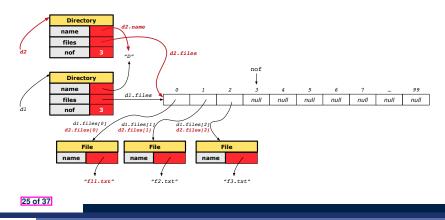

class Directory { **Directory** (Directory other) { /* value copying for primitive type */ nof = other.nof; /* address copying for reference type */ name = other.name; files = other.files; })

Is a shallow copy satisfactory to support composition? i.e., Does it still forbid sharing to occur? ØTest

public void testShallowCopyConstructor() { Directory d1 = new Directory("D"); dl.addFile("fl.txt"); dl.addFile("f2.txt"); dl.addFile("f3.txt"); Directory d2 = new Directory(d1); assertTrue(dl.getFiles() == d2.getFiles()); /* violation of composition */ d2.getFiles()[0].changeName("fll.txt"); assertFalse(d1.getFiles()[0].getName().equals("f1.txt"));

Composition: Dependent Containees Owned by Containers (1.4.2)

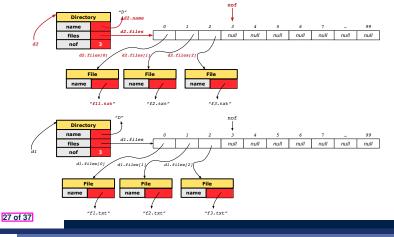

Right before test method testShallowCopyConstructor terminates:

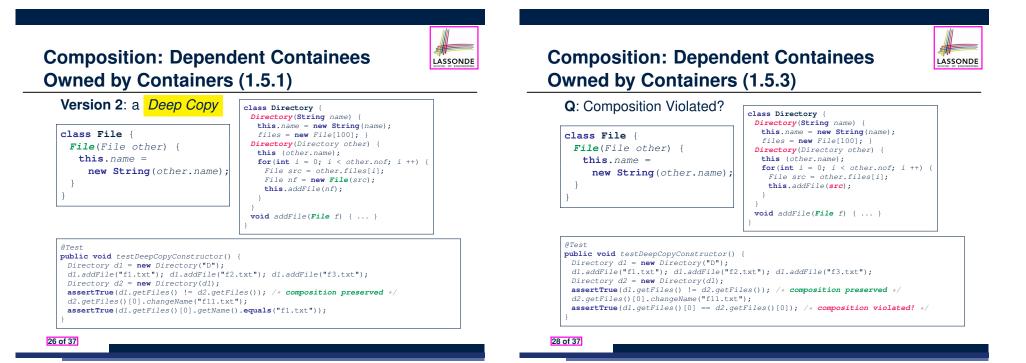

Composition: Dependent Containees Owned by Containers (1.5.2)

Right before test method testDeepCopyConstructor terminates:

LASSONDE

LASSONDE

Composition: Dependent Containees Owned by Containers (1.6)

Exercise: Implement the accessor in class Directory

class Directory {	
<pre>File[] files;</pre>	
<pre>int nof;</pre>	
<pre>File[] getFiles()</pre>	{
/* Your Task */	
}	
}	

so that it *preserves composition*, i.e., does not allow references of files to be shared.

29 of 37

Aggregation vs. Composition (2)

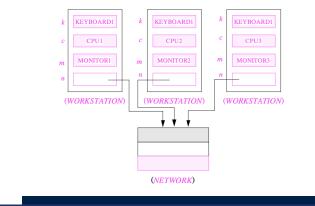

LASSONDE

[aggregations]

Aggregations and *Compositions* may exist at the same time! e.g., Consider a workstation:

- Each workstation owns CPU, monitor, keyword. [compositions]
- All workstations share the same network.

31 of 37

Aggregation vs. Composition (1)

Terminology:

- Container object: an object that contains others.
- Containee object: an object that is contained within another.

Aggregation :

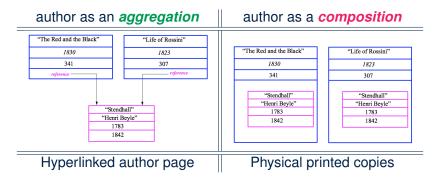

- Containees (e.g., Course) may be *shared* among containers (e.g., Student, Faculty).
- · Containees exist independently without their containers.
- When a container is destroyed, its containees still exist.

Composition :

- Containers (e.g, Directory, Department) *own* exclusive access to their containees (e.g., File, Faculty).
- Containees cannot exist without their containers.
- Destroying a container destroys its containeees *cascadingly*.

Aggregation vs. Composition (3)

Problem: Every published book has an author. Every author may publish more than one books. Should the author field of a book be implemented as an *aggregation* or a *composition*?

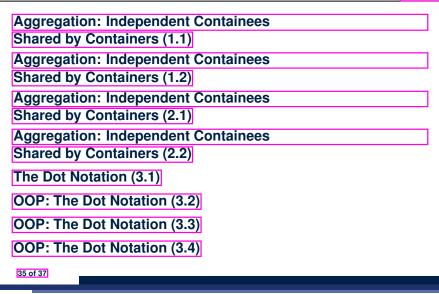

Beyond this lecture...

Reproduce the *aggregation* and *composition* code examples in Eclipse.

Tip. Use the debugger to verify whether or not there is *sharing*.
