

Lecture 13 - February 25

General Trees

Linear vs. Non-Linear Structures

General Trees: Terminology

Generic TreeNode in Java

Announcements/Reminders

- Survey on **Makeup Lecture** for ProgTest1
- **Assignment 3** (on linked Trees) to be released
- **WrittenTest** guide to be released
- This week's office hour: 3pm, Wed

Running Time: Arrays vs. SLL vs. DLL

see earlier discussion

DATA STRUCTURE		ARRAY	SINGLY-LINKED LIST	DOUBLY-LINKED LIST
OPERATION				
size				$O(1)$
first/last element				$O(1)$
element at index i		$O(1)$	$O(n)$	$O(1)$
remove last element			$O(n)$	$O(1)$
add/remove first element, add last element			$O(1)$	$O(1)$
add/remove i^{th} element	given reference to $(i - 1)^{th}$ element	$O(n)$	$O(1)$	$O(1)$
	not given			$O(n)$

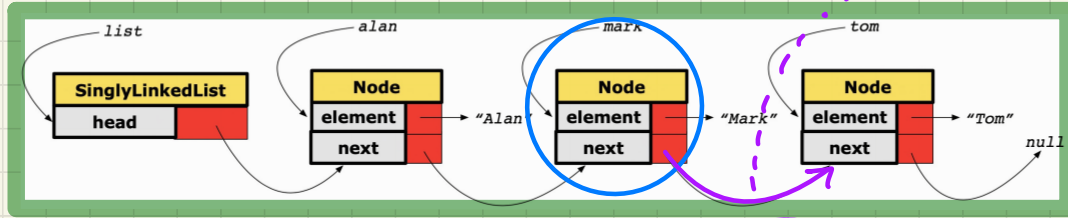

Trees

- a (1. General Trees
- 2. Binary Trees (BTs)
- b (3. Binary Search Trees (BSTs)
- 4. Balanced BSTs
- c (5. Priority Queues
- 6. Heap
- 7. Heap Sort

Linear vs. Non-Linear Structures

using next to access the unique successor

Index of unique pred. $i-1$
Index of unique succ. $i+1$

unique predecessor
unique successor
hierarchical structure (levels)

multiple "successors" of the root

↓
in programming they are stored in a linear DS (e.g. SLL)

General Trees: Terminology (1)

(unique) root of the tree
(the only node that has "null" parent).

parent of
S, V, P

- root
- parent
- children
- ancestors
- descendants
- siblings

children
of Elsa

nodes without
children

these 3 nodes
are siblings.
(at the same level).

unique ∴ parent is unique
↑

ANCESTOR path of shirley
(shirley), Elsa, Chris, (David)
n root

node	Descendants
Vanessa	Vanessa
Elsa	Elsa, S, V, P
David	all nodes in the tree.

A node is both its ancestor and descendant.

General Trees: Terminology (2)

Count(David) $\rightarrow 8$

Count(Ernesto)
 $\hookrightarrow$ recursively
count the size
of subtree
rooted at
1st child of
David
base case
 $\hookrightarrow 1$

Count(Chris)
 $4 + 1 + 1 = 6$
 $\hookrightarrow$ # of nodes
in subtree
rooted at
David's
2nd child

Count(Elsa)
 $\hookrightarrow 4$

Count(Anna)
 $\hookrightarrow 1$

Count(S)
 $\hookrightarrow 1$

Count(V)
 $\hookrightarrow 1$

Count(P)
 $\hookrightarrow 1$

Problem:

Given a node n ,
return the size of
subtree rooted at n .

Count(David) = 8

Count(Chris) = 6

Count(Shirley) = 1

- subtrees are the subproblems for you to make recursive
calls on.

How many subtreps
in total?

δ = # nodes in
the tree.

size	# subtreps
1	5
...	
δ	$\boxed{1}$ rooted at David.

General Trees: Terminology (3)

internal nodes → recursive cases.

- external nodes
- internal nodes

external nodes (leaves) → base cases

General Trees: Terminology (4)

- edge
- path
- depth
- height

depth of a nodeⁿ: # edges (parent links) from n to root.

height of a tree: max depth of descendants of its root.

Height of tree rooted at David:

3

Height of tree rooted at Elsa:

1.
